## OVERVIEW

The SED1560 series is a single-chip LCD driver for dot-matrix liquid crystal displays. It accepts serial or 8-bit parallel display data directly from a microprocessor and stores data in an on-chip 166 × 65-bit RAM.

The SED1560 features 167 common and segment outputs to drive either a 65 × 102-pixel (SED1560) display (4 rows × 6 columns with 16 × 16-pixel characters) or a 33 × 134-pixel (SED1561) display (2 rows × 8 columns with 16 × 16-pixel characters) or a 17 × 150-pixel (SED1562) display (1 row × 9 columns with 16 × 16 characters). In addition, two SED1560s can be connected together to drive a 65 × 268-pixel graphics display panel.

The SED 1560 series can read and write RAM data with the minimum current consumption as it does not require any external operation clock. Also, it has a built-in LCD power supply featuring the very low current consumption and, therefore, the display system of a high-performance but handy instrument can be realized by use of the minimum current consumption and LSI chip configuration.

The SED 1560 Series has the SED1560, SED1561 and SED1562 available according to the duty.

- On-chip 166 × 65-bit display RAM
- Direct relationship between RAM bits and display pixels.
- High speed Interfaces to 6800- and 8080-series micro-processors
- Selectable 8-bit parallel/serial interface
- Many command functions
- On-chip LCD power circuit including DC/DC voltage converter, voltage regulator and voltage followers.
- On-Chip Contrast control.
- Two types of VREG (Built-in power supply regulator temperature gradient).
- Type1 (SED156\*DO\*, SED156\*DA\*)...-0.2%/°C
- Type2 (SED1560DE\*)...0.00%/°C
- On-chip oscillator
- Ultra low power consumption
- Power Supply  
VDD – VSS –2.4 V to –6.0 V  
VDD – V5 –3.5 V to –16.0 V
- Ta = –30 to 85°C
- CMOS process
- TCP, QTCP
- The system is not designed against the radio activity.

## FEATURES

- Wide variety of duty and display areas

Model	Duty	LCD bias	Single-chip display area
SED1560	1/65	1/9 1/7	65 × 102
	1/64		64 × 102
	1/49		49 × 102
	1/48		48 × 102
SED1561	1/33	1/7 1/5	33 × 134
	1/32		32 × 134
	1/25		25 × 134
	1/24		24 × 134
SED1562	1/17	1/5	17 × 150
	1/16		16 × 150

**Note:** The LCD bias is obtained if the built-in power supply is used.

PAD LAYOUT

- Chip size : 8.08 × 5.28 mm
- Pad pitch : 100 μm (Min.)
- Chip thickness : 625 μm
- : 300 μm (Al-pad)
- Au-Bump
  - Bump size A : 103 μm × 95 μm (Typ.) (Pad No. 1 ~ 6, 18, 36 ~ 42, 44 ~ 49)
  - Bump size B : 69 μm × 95 μm (Typ.) (other then the above)
  - Bump hight : 23 μm (Typ.)
- Al-pad
  - Pad size A : 111 μm × 102 μm (Typ.) (Pad No. 1 ~ 6, 18, 36 ~ 42, 44 ~ 49)
  - Bump size B : 77 μm × 99 μm (Typ.) (Other then the above)

## PIN DESCRIPTION

### Power Supply

Number of pins	I/O	Name	Description																				
2	Supply	VDD	5V supply. Common to MPU power supply pin Vcc.																				
2	Supply	VSS	Ground																				
11	Supply	V1 to V5	<p>LCD driver supply voltages. The voltage determined by the LCD cell is impedance-converted by a resistive divider or an operational amplifier for application. Voltages should be determined on a VDD-basis so as to satisfy the following relationship. The voltages must satisfy the following relationship.</p> $V_{DD} \geq V_0 \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5.$ <p>When master mode selects, these voltages are generated on-chip.</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th></th> <th>SED1560D0B</th> <th>SED1560DAB SED1561D0B</th> <th>SED1561DAB SED1562D0B</th> </tr> </thead> <tbody> <tr> <td><b>V1</b></td> <td>1/9 V5</td> <td>1/7 V5</td> <td>1/5 V5</td> </tr> <tr> <td><b>V2</b></td> <td>2/9 V5</td> <td>2/7 V5</td> <td>2/5 V5</td> </tr> <tr> <td><b>V3</b></td> <td>7/9 V5</td> <td>5/7 V5</td> <td>3/5 V5</td> </tr> <tr> <td><b>V4</b></td> <td>8/9 V5</td> <td>6/7 V5</td> <td>4/5 V5</td> </tr> </tbody> </table>		SED1560D0B	SED1560DAB SED1561D0B	SED1561DAB SED1562D0B	<b>V1</b>	1/9 V5	1/7 V5	1/5 V5	<b>V2</b>	2/9 V5	2/7 V5	2/5 V5	<b>V3</b>	7/9 V5	5/7 V5	3/5 V5	<b>V4</b>	8/9 V5	6/7 V5	4/5 V5

**Microprocessor Interface**

Number of pins	I/O	Name	Description																					
8	I/O	D0 to D7	Data inputs/outputs																					
1	I	A0	Control/display data flag input. This is connected to the LSB of the microprocessor address bus. When LOW, the data on D0 to D7 is control data. When HIGH, the data on D0 to D7 is display data.																					
1	I	$\overline{\text{RES}}$	Reset input. System is reset and initialized when LOW.																					
2	I	$\overline{\text{CS1}}$ , CS2	Chip select inputs. Data input/output is enabled when CS1 is LOW and CS2 is HIGH.																					
1	I	$\overline{\text{RD}}$ (E)	Read enable input. See note. 1																					
1	I	$\overline{\text{WR}}$ (R/W)	Write enable input. See note. 2																					
1	I	C86	Microprocessor interface select input. LOW when interfacing to 8080-series. HIGH when interfacing to 6800-series.																					
1	I	SI	Serial data input																					
1	I	SCL	Serial clock input. Data is read on the rising edge of SCL and converted to 8-bit parallel data.																					
1	I	P/S	Parallel/serial data input select <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>P/S</th> <th>Operating mode</th> <th>Chip select</th> <th>Data/command</th> <th>Data input/output</th> <th>Read/write</th> <th>Serial clock</th> </tr> </thead> <tbody> <tr> <td>HIGH</td> <td>Parallel</td> <td><math>\overline{\text{CS1}}</math>, CS2</td> <td>A0</td> <td>D0 to D7</td> <td><math>\overline{\text{RD}}</math>, <math>\overline{\text{WR}}</math></td> <td>—</td> </tr> <tr> <td>LOW</td> <td>Serial</td> <td><math>\overline{\text{CS1}}</math>, CS2</td> <td>A0</td> <td>SI</td> <td>Write only</td> <td>SCL</td> </tr> </tbody> </table> <p>In serial mode, data cannot be read from the RAM, and D0 to D7, HZ, <math>\overline{\text{RD}}</math> and <math>\overline{\text{WR}}</math> must be HIGH or LOW. P/S	Operating mode	Chip select	Data/command	Data input/output	Read/write	Serial clock																		
HIGH	Parallel	$\overline{\text{CS1}}$ , CS2	A0	D0 to D7	$\overline{\text{RD}}$ , $\overline{\text{WR}}$	—																		
LOW	Serial	$\overline{\text{CS1}}$ , CS2	A0	SI	Write only	SCL																		

**Note 1**

When interfacing to 8080-series microprocessors,  $\overline{\text{RD}}$  is active-LOW. When interfacing to 6800-series microprocessors, they are active-HIGH.

**Note 2**

When interfacing to 8080-series microprocessors,  $\overline{\text{WR}}$  is active-LOW. When interfacing to 6800-series microprocessors, It will be read mode when  $\overline{\text{WR}}$  is high and It will be write mode when  $\overline{\text{WR}}$  is LOW.

## Oscillator and Timing Control

Number of pins	I/O	Name	Description																													
2	I	OSCI	Connecting pins for feedback resistors of the built-in oscillator When M/S = "H": Connect oscillator resistor Rf to the OSC1 and OSC2 pins. The OSC2 pin is used for output of the oscillator amplifier.																													
2	I/O	OSC2	When M/S = "L": The OSC2 pin is used for input of oscillation signal. The OSC1 pin should be left open. Fix the CL pin to the Vss level when using the internal oscillator circuit as the display clock.																													
1	I	CL	Display clock input. The line counter increments on the rising edge of CL and the display pattern is output on the falling edge. When use external display clock, OSC1 = "H", OSC2 = "L" and reset this LSI by RES pin.																													
1	O	CLO	Display clock output. When using the master operation, the clock signal is output on this pin. Connect CLO to YSCL on the common driver.																													
1	I	M/S	Master/slave select input. Master makes some signals for display, and slave gets them. This is for display synchronization. <table border="1" data-bbox="598 884 1428 1003"> <thead> <tr> <th>Device</th> <th>M/S</th> <th>Operating mode</th> <th>Internal oscillator</th> <th>Power supply</th> <th>FR</th> <th>SYNC</th> <th>OSC1</th> <th>OSC2</th> <th>DYO</th> </tr> </thead> <tbody> <tr> <td rowspan="2">156XD0B</td> <td>Low</td> <td>Slave</td> <td>OFF</td> <td>OFF</td> <td>I</td> <td>I</td> <td>Open</td> <td>I</td> <td>O</td> </tr> <tr> <td>HIGH</td> <td>Master</td> <td>ON</td> <td>ON</td> <td>O</td> <td>O</td> <td>I</td> <td>O</td> <td>O</td> </tr> </tbody> </table> <p><b>Note</b> I = input mode O = output mode</p>	Device	M/S	Operating mode	Internal oscillator	Power supply	FR	SYNC	OSC1	OSC2	DYO	156XD0B	Low	Slave	OFF	OFF	I	I	Open	I	O	HIGH	Master	ON	ON	O	O	I	O	O

	HIGH	Master	ON	ON	O	O	I	O	O																							
1	I/O	FR	LCD AC drive signal input/output. If the SED1560 series MPU's are used in master and slave configuration, this pin must be connected to each FR pin. Also when the SED1560 series is used as the master MPU, this pin must be connected to the FR pin of the common driver. Output is selected when M/S is HIGH, and input is selected when M/S is LOW.																													
1	I/O	SYNC	Display sync input/output. If the SED1560 series MPU's are used in master and slave configuration, this pin must be connected to each SYNC pin. Output is selected when M/S is HIGH, and Input is selected when M/S is LOW.																													
1	O	DYO	Start-up output for common driver. Connect to DIO of the common driver.																													

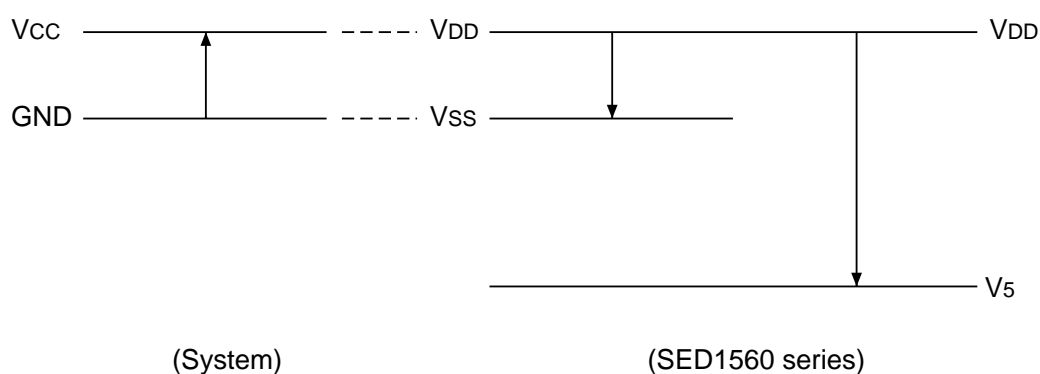

**LCD Driver Outputs**

## SPECIFICATIONS

### Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit
Supply voltage (1)	V <sub>SS</sub>	-7.0 +0.03	V
Supply voltage range (2) (DC/DC When in use)		-6.0 to 0.3 (when triple boosting)	
Driver supply voltage range (1)	V <sub>5</sub>	-18.0 to 0.3	V
Driver supply voltage range (2)	V <sub>1</sub> , V <sub>2</sub> , V <sub>3</sub> , V <sub>4</sub>	V <sub>5</sub> to 0.3	V
Input voltage range	V <sub>IN</sub>	V <sub>SS</sub> -0.3 to 0.3	V
Output voltage range	V <sub>O</sub>	V <sub>SS</sub> -0.3 to 0.3	V
Operating temperature range	T <sub>opr</sub>	-30 to 85	deg. C
Storage temperature range (TCP)	T <sub>str</sub>	-55 to 100	deg. C

- Notes:**
1. The voltages shown are based on V<sub>DD</sub> = 0 V.
  2. Always keep the condition of V<sub>DD</sub> ≥ V<sub>1</sub> ≥ V<sub>2</sub> ≥ V<sub>3</sub> ≥ V<sub>4</sub> ≥ V<sub>5</sub> for voltages V<sub>1</sub>, V<sub>2</sub>, V<sub>3</sub> and V<sub>4</sub>.
  3. If LSIs are used over the absolute maximum rating, the LSIs may be destroyed permanently. It is desirable to use them under the electrical characteristic conditions for general operation. Otherwise, a malfunction of the LSI may be caused and LSI reliability may be affected.
  4. A guarantee on operating temperature below -30°C may be studied individually.

DC Characteristics

V<sub>DD</sub> = 0 V, V<sub>SS</sub> = -5 V ± 10%, Ta = -30 to +85°C unless otherwise noted.

Item		Symbol	Condition	Min.	Typ.	Max.	Unit	Pin used

Reset "L" pulse width	t <sub>RW</sub>			1.0			μs	*11

Built-in power circuit	Input voltage	V <sub>SS</sub>		-6.0		-2.4	V	*12	
	Amplified output voltage	V <sub>OUT</sub>	when triple boosting	-18.0			V	V <sub>OUT</sub>	
	Voltage regulator operation voltage	V <sub>OUT</sub>		-16.0		-6.0	V	V <sub>OUT</sub>	
	Voltage regulator operation voltage	V <sub>5</sub> ①	Supplied to SED1560D <sub>OB</sub>		-16.0		-6.0	V	*13
		V <sub>5</sub> ②	Supplied to SED1561D <sub>OB</sub>		-16.0		-5.0	V	
		V <sub>5</sub> ③	Supplied to SED1561D <sub>AB</sub>		-16.0		-4.0	V	
V <sub>5</sub> ④		Supplied to SED1562D <sub>OB</sub>		-16.0		-4.5	V		
Reference voltage	V <sub>REG</sub>	Ta = 25°C		-2.35	-2.5	-2.65	V		

\*V<sub>SS</sub> = -2.4V is on the same basis as V<sub>SS</sub> = -2.7V.

\* See the 4-12 page for details.

When dynamic current consumption (I) is displayed; the built-in power circuit is on and T1 = T2 = Low.

V<sub>DD</sub> = 0 V, V<sub>SS</sub> = -5 V ± 10%, Ta = -30 to +85°C unless otherwise noted.

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Remarks
SED1560	I <sub>DD</sub> (1)	V <sub>5</sub> = -12.5 V; 3 times amplified		169	340	μA	*16
SED1561		V <sub>5</sub> = -8.0 V; 3 times amplified		124	250	μA	
SED1562		V <sub>5</sub> = -6.0 V; 2 times amplified		53	110	μA	
		V <sub>SS</sub> = -2.7 V; 3 times amplified V <sub>5</sub> = -6.0 V		66	130	μA	

**Typical current consumption characteristics**

- Dynamic current consumption (I), if an external clock and an external power supply are used.

Conditions: The built-in power supply is off but the external one is used.

SED1560 V<sub>5</sub> - V<sub>DD</sub> = -12.5 V

SED1561 V<sub>5</sub> - V<sub>DD</sub> = -8.0 V

SED1562 V<sub>5</sub> - V<sub>DD</sub> = -6.0 V

External clock:

SED1560 f<sub>CL</sub> = 4 kHz

SED1561 f<sub>CL</sub> = 2 kHz

SED1562 f<sub>CL</sub> = 1 kHz

Remarks: \*14

- Dynamic current consumption (I), if the built-in oscillator and the external power supply are used.

Conditions: The built-in power supply is off but the external one is used.

SED1560 V<sub>5</sub> - V<sub>DD</sub> = -12.5 V

SED1561 V<sub>5</sub> - V<sub>DD</sub> = -8.0 V

SED1562 V<sub>5</sub> - V<sub>DD</sub> = -6.0 V

Internal oscillation:

SED1560 R<sub>f</sub> = 1 MΩ

SED1561 R<sub>f</sub> = 1 MΩ

SED1562 R<sub>f</sub> = 1 MΩ

Remarks: \*15

- Dynamic current consumption (I), if the built-in power supply is used.

Conditions: The built-in power supply is on and T1 = T2 = Low.

SED1560 V<sub>5</sub> - V<sub>DD</sub> = -12.5 V; 3 times amplified

SED1561 V<sub>5</sub> - V<sub>DD</sub> = -8.0 V; 3 times amplified

SED1562 V<sub>5</sub> - V<sub>DD</sub> = -6.0 V; 2 times amplified

Internal oscillation:

SED1560 R<sub>f</sub> = 1 MΩ

SED1561 R<sub>f</sub> = 1 MΩ

SED1562 R<sub>f</sub> = 1 MΩ

Remarks: \*16

- Notes:**
- \*1. Although the wide range of operating voltage is guaranteed, a spike voltage change during access to the MPU is not guaranteed.
  - \*2. The operating voltage range of the V<sub>SS</sub> and V<sub>5</sub> systems (see Figure 11). The operating voltage range is applied if an external power supply is used.
  - \*3. Pins A0, D0 to D7,  $\overline{RD}$  (E),  $\overline{WR}$  (R/W),  $\overline{CS1}$ , CS2, FR, SYNC, M/S, C86, SI, P/S, T1 and T2.
  - \*4. Pins CL, SCL, and  $\overline{RES}$
  - \*5. Pins D0 to D7, FR, SYNC, CL0, and DY0
  - \*6. Pins A0,  $\overline{RD}$  (E),  $\overline{WR}$  (R/W),  $\overline{CS1}$ , CS2, CL, M/S,  $\overline{RES}$ , C86, SI, SCL, P/S, T1, and T2.
  - \*7. Applied if pins D0 to D7, FR, and SYNC are high impedance.
  - \*8. The resistance when the 0.1-volt voltage is applied between the “On” output terminal and each power terminal (V1, V2, V3 or V4). It must be within the operating voltage (2).  
 $R_{ON} = 0.1 \text{ V} / \Delta I$   
 ( $\Delta I$  is the current that flows when 0.1 VDC is applied during power-on.)
  - \*9. The relationship between the oscillation frequency, frame and R<sub>f</sub> value (see Figure 10).
  - \*10. “tr” (reset time) indicates the period between the time when the  $\overline{RES}$  signal rises and when the internal circuit has been reset. Therefore, the SED156\* is usually operable after “tr” time.
  - \*11. Specifies the minimum pulse width of  $\overline{RES}$  signal. The Low pulse greater than “tr<sub>rw</sub>” must be entered for reset.
  - \*12. If the voltage is amplified three times by the built-in power circuit, the primary power V<sub>SS</sub> must be used within the input voltage range.
  - \*13. The V<sub>5</sub> voltage can be adjusted within the voltage follower operating range by the voltage regulator circuit.
  - \*14, 15, 16 Indicates the current consumed by the separate IC. The current consumption due to the LCD panel capacity and wiring capacity is not included. The current consumption is shown if the checker is used, the display is turned on, the output status of Case 6 is selected, and the SED1560D0B is set to 1/64 duty, the SED1561D0B is set to 1/32 duty, and the SED1562D0B is set to 1/16 duty.
  - \*14. Applied if an external clock is used and if not accessed by the MPU.
  - \*15. Applied if the built-in oscillation circuit is used and if not accessed by the MPU.
  - \*16. Applied if the built-in oscillation circuit and the built-in power circuit are used (T1 = T2 = Low) and if not accessed by the MPU. Measuring conditions: C1 = 4.7 μF, C2 = 0.47 μF, R<sub>a</sub> + R<sub>b</sub> = 2 MΩ. This includes the current that flows through the voltage regulator resistor (R<sub>a</sub> + R<sub>b</sub> = 2 MΩ). If the built-in power circuit is used, the current consumption is equal to the current of V<sub>SS</sub> power.

**Oscillator frequency vs. frame vs. Rf  
[SED156\*D0B]**

Figure 10 (a)

The relationship between oscillator frequency  $f_{osc}$  and LCD frame frequency  $f_F$  is obtained from the following expression.

	Duty	$f_F$
SED1560	1/64	$f_{OSC}/256$
	1/48	$f_{OSC}/192$
SED1561	1/32	$f_{OSC}/256$
	1/24	$f_{OSC}/192$
SED1562	1/16	$f_{OSC}/256$

( $f_F$  indicates not  $f_F$  signal cycle but cycle of LCD AC.)

**External clock (f<sub>CL</sub>) vs. frame [SED156\*D\*B]**

Figure 10 (b)

Operating voltage range for Vss and V5

Figure 11

Power consumption during access (IDD (2)) - MPU access cycle

Figure 12

This graphic shows the current consumption when the vertical patterns are written during “fcyc”. If not accessed, IDD(1) is only shown.

Reset

Parameter	Symbol	Condition	Rating			Unit
			Min.	Typ.	Max.	
Reset time	t <sub>R</sub>	See note.	1.0	—	—	μs
Reset LOW-level pulsewidth	t <sub>RW</sub>		1.0	—	—	μs

Note

t<sub>R</sub> is measured from the rising edge of  $\overline{\text{RES}}$ . The SED1560 enters normal operating mode after a reset.

Display control timing

Input timing

$V_{SS} = -5.5$  to  $-4.5$  V,  $T_a = -30$  to  $85$  deg. C

Parameter	Symbol	Condition	Rating			Unit
			Min.	Typ.	Max.	
CL LOW-level pulsewidth	$t_{WLCL}$		35	—	—	$\mu s$
CL HIGH-level pulsewidth	$t_{WHCL}$		35	—	—	$\mu s$
CL rise time	$t_r$		—	30	—	ns
CL fall time	$t_f$		—	30	—	ns
FR delay time	$t_{DFR}$		-1.0	—	1.0	$\mu s$
SYNC delay time	$t_{DSNC}$		-1.0	—	1.0	$\mu s$

$V_{SS} = -4.5$  to  $-2.7$  V,  $T_a = -30$  to  $85$  deg. C

Parameter	Symbol	Condition	Rating			Unit
			Min.	Typ.	Max.	
CL LOW-level pulsewidth	$t_{WLCL}$		35	—	—	$\mu s$
CL HIGH-level pulsewidth	$t_{WHCL}$		35	—	—	$\mu s$
CL rise time	$t_r$		—	40	—	ns
CL fall time	$t_f$		—	40	—	ns
FR delay time	$t_{DFR}$		-1.0	—	1.0	$\mu s$
SYNC delay time	$t_{DSNC}$		-1.0	—	1.0	$\mu s$

- Notes:**
1. Effective only when the SED156\*DOB is in the master mode.
  2. The FR/SYNC delay time input timing is provided in the slave operation.  
The FR/SYNC delay time output timing is provided in the master operation.
  3. Each timing is based on 20% and 80% of  $V_{SS}$ .
  4. When using in the range of  $V_{SS} = -2.4 \sim -4.5V$ , raise the above ratings for  $-2.7 \sim -4.5V$  equally by 30%.

Output timing

$V_{SS} = -5.5$  to  $-4.5$  V,  $T_a = -30$  to  $85$  deg. C

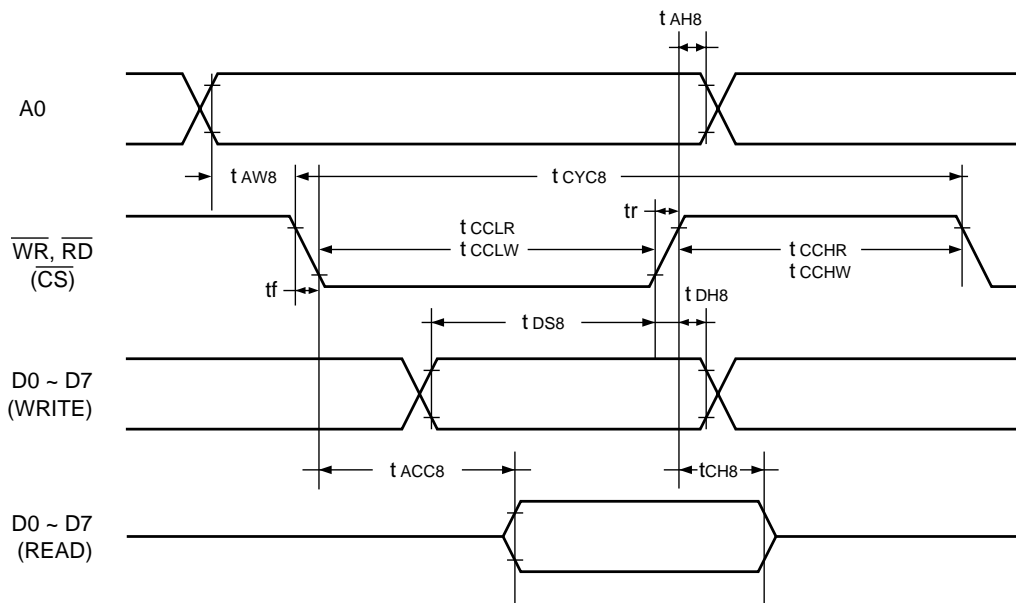

Parameter	Symbol	Condition	Rating			Unit
			Min.	Typ.	Max.	
FR delay time	$t_{DFR}$	$C_L = 50$ pF	—	60	150	ns
SYNC delay time	$t_{DSNC}$		—	60	150	ns
DYO LOW-level delay time	$t_{DOL}$		—	70	160	ns
DYO HIGH-level delay time	$t_{DOH}$		—	70	160	ns
CLO to DYO Low-level delay time	$t_{CDL}$	SED156*D0B operating in master mode only	10	40	100	ns
CLO to DYO HIGH-level delay time	$t_{CDH}$	SED156*D0B operating in master mode only	10	40	100	ns

$V_{SS} = -4.5$  to  $-2.7$  V,  $T_a = -30$  to  $85$  deg. C

Parameter	Symbol	Condition	Rating			Unit
			Min.	Typ.	Max.	
FR delay time	$t_{DFR}$	$C_L = 50$ pF	—	120	240	ns
SYNC delay time	$t_{DSNC}$		—	120	240	ns
DYO LOW-level delay time	$t_{DOL}$		—	140	250	ns
DYO HIGH-level delay time	$t_{DOH}$		—	140	250	ns
CLO to DYO LOW-level delay time	$t_{CDL}$	SED156*D0B operating in master mode only	10	100	200	ns
CLO to DYO HIGH-level delay time	$t_{CDH}$	SED156*D0B operating in master mode only	10	100	200	ns

\*1. All signal timings are limited based on the 20% and 80% of V<sub>SS</sub> voltage.

\*2. When using in the range of V<sub>SS</sub> = -2.4 ~ -4.5V, raise the above ratings for -2.7 ~ -4.5V equally by 30%.

## FUNCTIONAL DESCRIPTION

### Microprocessor Interface

#### Parallel/serial interface

Parallel data can be transferred in either direction between the controlling microprocessor and the SED1560 series through the 8-bit I/O buffer (D0 to D7). Serial data can be sent from the microprocessor to the SED1560

series through the serial data input (SI), but not from the SED1560 series to the microprocessor. The parallel or serial interface is selected by P/S as shown in table 1.

Table 1. Parallel/serial interface selection

P/S	Input type	$\overline{CS1}$	CS2	A0	$\overline{RD}$	$\overline{WR}$	C86	SI	SCL	D0 to D7
HIGH	Parallel	$\overline{CS1}$	CS2	A0	$\overline{RD}$	$\overline{WR}$	C86	—	—	D0 to D7
LOW	Serial	$\overline{CS1}$	CS2	A0	—	—	—	SI	SCL	(Hz)

#### Note

“—” indicates fixed to either “H” or to “L”

For the parallel interface, the type of microprocessor is selected by C86 as shown in table 2.

Table 2. Microprocessor selection for parallel interface

C86	MPU bus type	$\overline{CS1}$	CS2	A0	$\overline{RD}$	$\overline{WR}$	D0 to D7
HIGH	6800-series	$\overline{CS1}$	CS2	A0	E	R/ $\overline{W}$	D0 to D7
LOW	8080-series	$\overline{CS1}$	CS2	A0	$\overline{RD}$	$\overline{WR}$	D0 to D7

#### Parallel interface

A0,  $\overline{WR}$  (or R/W) and  $\overline{RD}$  (or E) identify the type of parallel data transfer to be made as shown in table 3.

#### Serial interface

The serial interface comprises an 8-bit shift register and a 3-bit counter. These are reset when  $\overline{CS1}$  is HIGH and CS2 is LOW. When these states are reversed, serial data and clock pulses can be received from the microprocessor on SI and SCL, respectively.

Table 3. Parallel data transfer

Common	6800 series		8080 series		Description
	A0	R/W	E	$\overline{RD}$	
1	1	1	0	1	Display data read out
1	0	1	1	0	Display data write
0	1	1	0	1	Status read
0	0	1	1	0	Write to internal register (command)

Serial data is read on the rising edge of SCL and must be input at SI in the sequence D7 to D0. On every eighth clock pulse, the data is transferred from the shift register and processed as 8-bit parallel data.

Input data is display data when A0 is HIGH and control data when A0 is LOW. A0 is read on the rising edge of every eighth clock signal.

The SLC signal is affected by the termination reflection and external noise caused by the line length. The operation check on the actual machine is recommended.

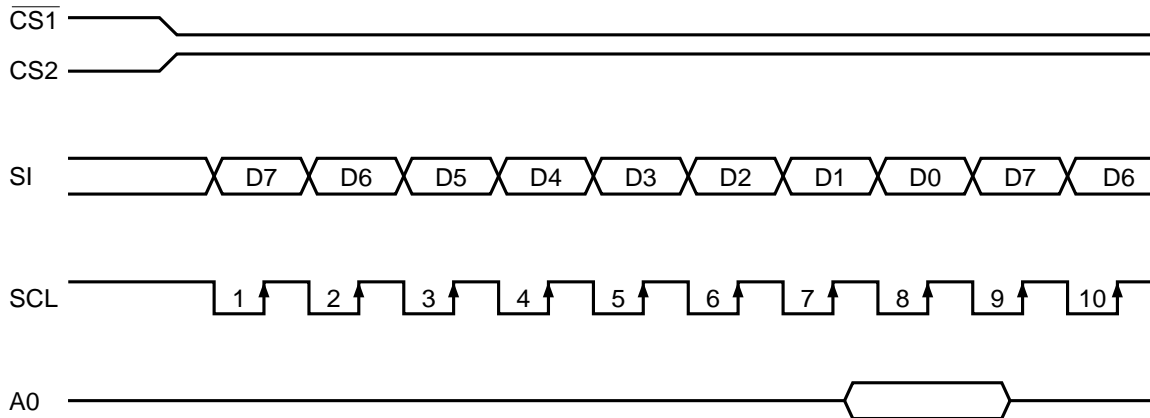

Figure 1. Serial interface timing

**Chip select inputs**

The SED1560 series has two chip select pins:  $\overline{CS1}$  and CS2, and data exchange between the microprocessor and the SED1560 series is enabled when  $\overline{CS1}$  is LOW and CS2 is HIGH. When these pins are set to any other combination, D0 to D7 are high impedance. The A0,  $\overline{RD}$ ,  $\overline{WR}$ , SI and SCI inputs are disabled. If the serial input interface has been selected, the shift register and counter are reset. The Reset signal is entered independent from the  $\overline{CS1}$  and CS2 status.

**Data Transfer**

To match the timing of the display data RAM and registers to that of the controlling microprocessor, the SED1560 series uses an internal data bus and bus buffer. A kind of pipeline processing takes place. When the microprocessor reads the contents of RAM, the data for the initial read cycle is first stored in the bus buffer

(dummy read cycle). On the next read cycle, the data is read from the bus buffer onto the microprocessor bus. At the same time, the next block of data is transferred from RAM to the bus buffer. Likewise, when the microprocessor writes data to display data RAM, the data is first stored in the bus buffer before being written to RAM at the next write cycle.

When writing data from the microprocessor to RAM, there is no delay since data is automatically transferred from the bus buffer to the display data RAM. If the data rate is required to slow down, the microprocessor can insert a NOP instruction which has the same affect as executing a wait procedure.

When a sequence of address sets is executed, a dummy read cycle must be inserted between each pair of address sets. This is necessary because the addressed data from the RAM is delayed one cycle by the bus buffer, before it is sent to the microprocessor. A dummy read cycle is thus necessary after an address set and after a write cycle.

Figure 2. Write timing

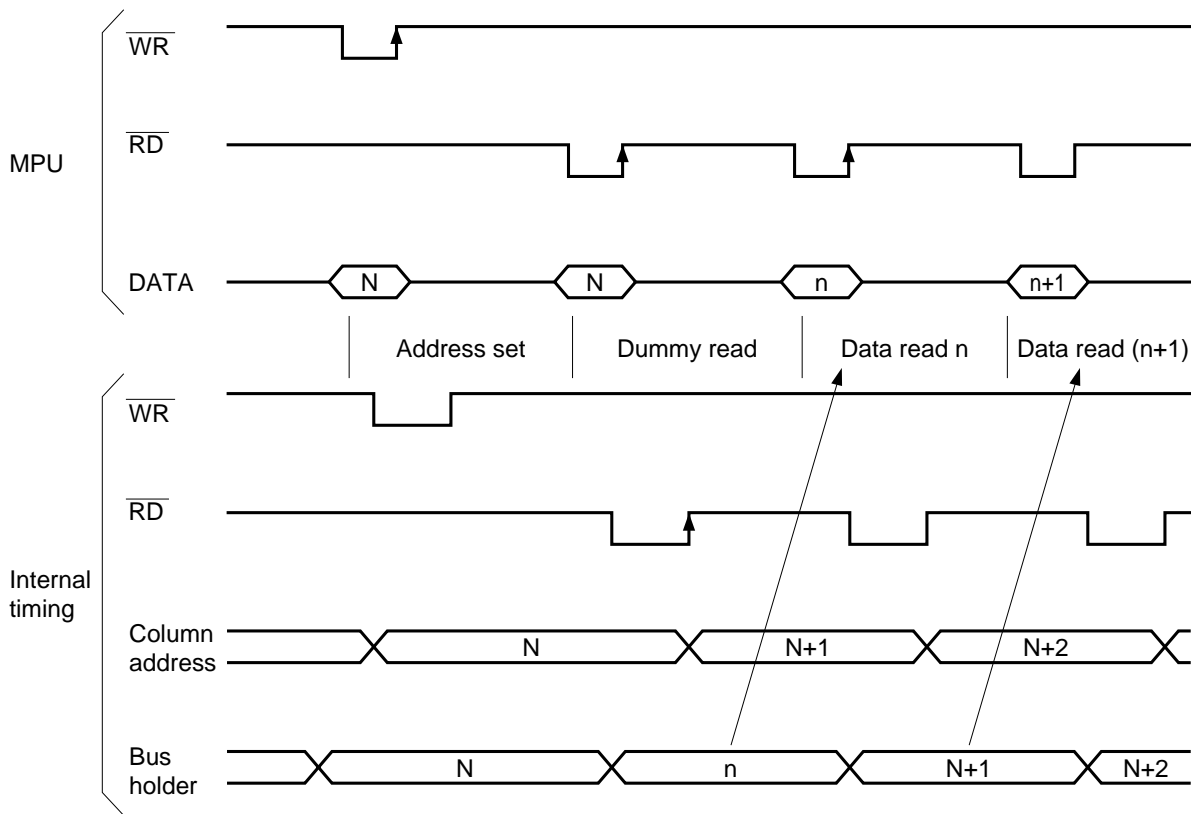

Figure 3. Read timing

### Status Flag

The SED1560 series has a single bit status flag, D7. When D7 is HIGH, the device is busy and will only accept a Status Read command. If cycle times are

monitored carefully, this flag does not have to be checked before each command, and microprocessor capabilities can be fully utilized.

### Display Data RAM

The display data RAM stores pixel data for the LCD. It is a 166-column × 65-row addressable array as shown in figure 4.

(If the display start line is set to 1ch)

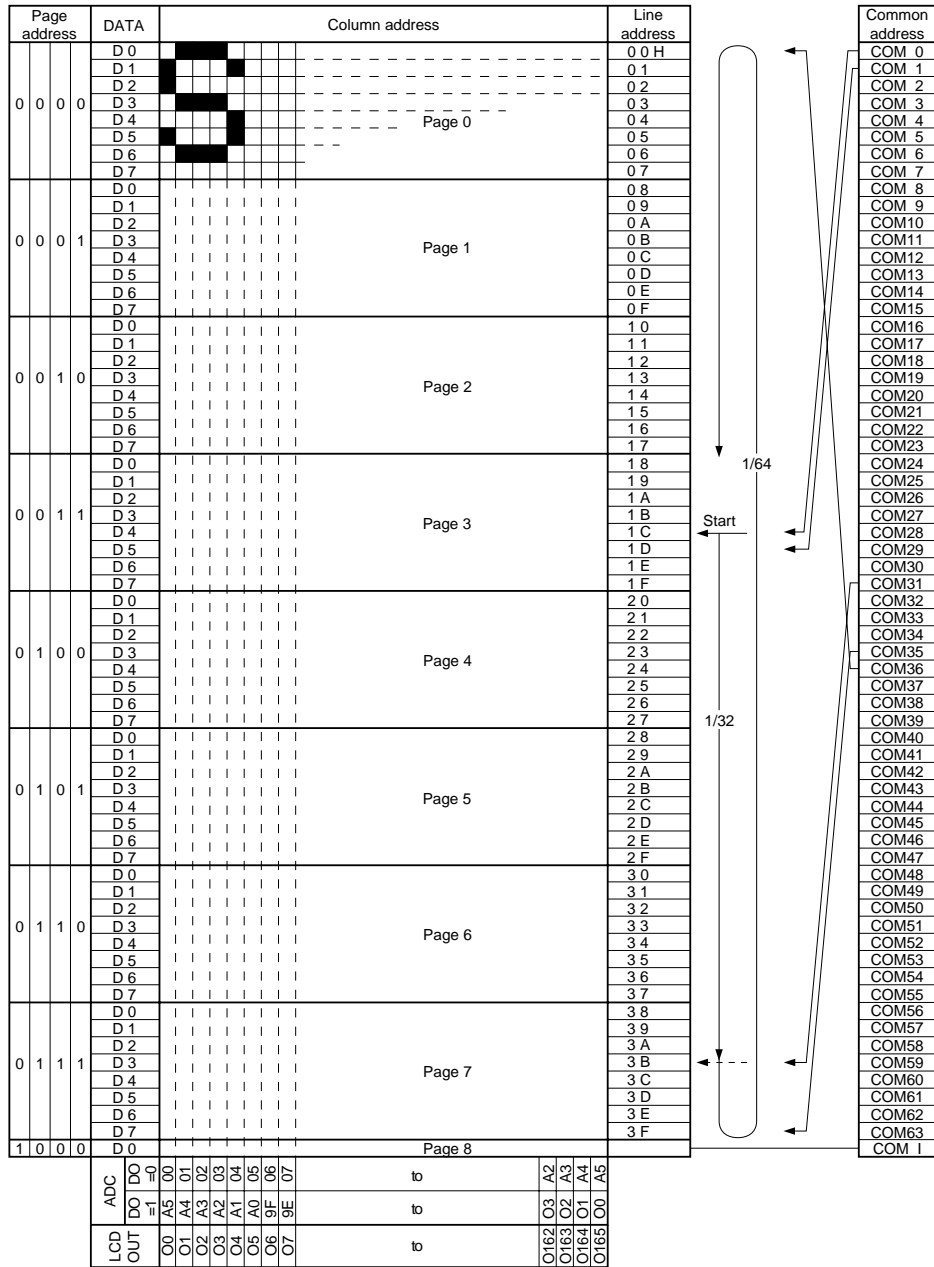

Figure 4. Display data RAM addressing

**Note**

For a 1/65 and 1/33 display duty cycles, page 8 is accessed following 1BH and 3BH, respectively.

The 65 rows are divided into 8 pages of 8 lines and a ninth page with a single line (D0 only). Data is read from or written to the 8 lines of each page directly through D0 to D7.

The time taken to transfer data is very short, because the microprocessor inputs D0 to D7 correspond to the LCD common lines as shown in figure 5. Large display configurations can thus be created using multiple SED1560s.

Figure 5. RAM-to-LCD data transfer

The microprocessor reads from and writes to RAM through the I/O buffer. Since the LCD controller operates independently, data can be written to RAM at the same time as data is being displayed, without causing the LCD to flicker.

### Column Address Counter

The column address counter is an 8-bit presettable counter that provides the column address to display data RAM. See figure 4. It is incremented by 1 each time a read or write command is received. The counter automatically stops at the highest address, A6H. The contents of the column address counter are changed by the Column Address Set command. This counter is independent of the page address register.

When the Select ADC command is used to select inverse display operation, the column address decoder inverts the relationship between the RAM column data and the display segment outputs.

### Page Address Register

The 4-bit page address register provides the page address to display data RAM. The contents of the register are changed by the Page Address Set command.

Page address 8 (D3 = H, D2, D1, D0 = L) is a special use RAM area for the indicator.

### Initial Display Line Register

The initial display line register stores the address of the RAM line that corresponds to the first (normally the top)

line (COM0) of the display. See figure 4. The contents of this 6-bit register are changed by the Initial Display Line command. At the start of each LCD frame, synchronized with SYNC, the initial line is copied to the line counter. The line counter is then incremented on the CL clock signal once for every display line. This generates the line addresses for the transfer of the 166 bits of RAM data to the LCD drivers.

If a 1/65 or 1/33 display duty cycle is selected by the Duty + 1 command, the line address corresponding to the 65th or 33rd SYNC signal is changed and the indicator special-use line address is selected. If the Duty + 1 command is not used, the indicator special-use line address is not selected.

### Output Selection Circuit

The number of common (COM) and segment (SEG) driver outputs can be selected to fit different LCD panel configurations by the output selection circuit.

There are 70 segment-only outputs (O32 to O101) and 96 common or segment dual outputs (O0 to O31 and O102 to O165). A command select the status of the dual common/segment outputs. Figure 6 shows the six different LCD driver arrangements.

Necessary LCD driver voltage is automatically allocated to the COM/SEG dual outputs when their function is determined by the output selection circuit.

The SED1560 selects Case 1, 2 or 6 while the SED1561 selects Case 3, 4, 5 or 6. As to the SED1562, COM/SEG output status cannot be selected, being fixed.

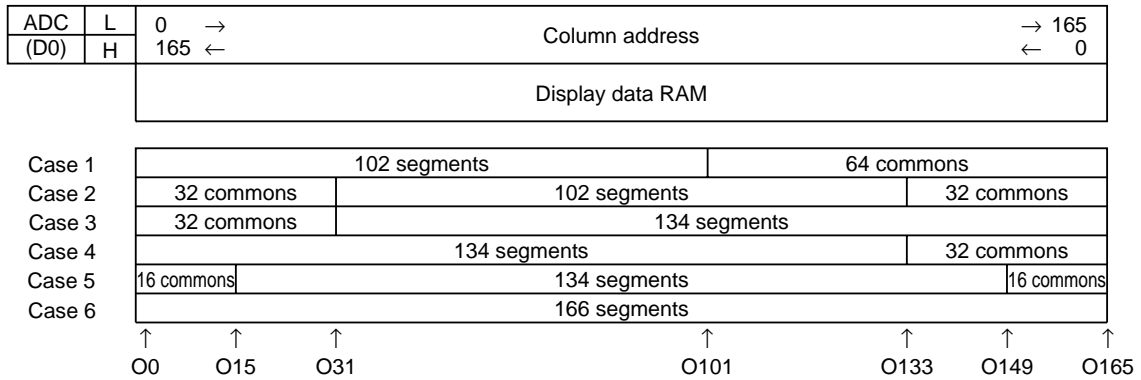

Figure 6. Output configuration selection

When COM outputs are assigned to the output drivers, the unused RAM area is not available. However, all RAM column addresses can still be accessed by the microprocessor. Since duty setting and output selection are independent,

the appropriate duty must be selected for each case. Cases 1 to 6 are determined according to the three lowest bits in the output status register in the output selection circuit. The COM output scanning direction can be selected by setting bit D3 in the output status register to “H” or “L”.

Table 4

	SED1560		SED1561		SED1562
Duty	1/64	1/48	1/32	1/24	1/16
COM I function	COM64	COM48	COM32	COM24	COM16

When the DUTY + 1 command is executed, pin COM1 becomes as shown in Figure 4 irrelevant to output selection: Since master/slave operation and the output selection circuit are completely independent in the SED1560 series, a chip either on the master or slave side can be

allocated to the COM output function in multi-chip configuration. The LCD driver outputs shown in Table 5 become ineffective when the SED1560 or SED1561 is used with 1/48 or 1/24 duty, respectively. In this case, ineffective outputs are used in the open state.

Table 5

		Output status register				Ineffective output
		D3	D2	D1	D0	
SED1560	Case 1	0	1	0	1	O150 to O165
		1	1	0	1	O102 to O117
	Case 2	0	1	0	0	O150 to O165
		1	1	0	0	O16 to O31
SED1561	Case 3	0	0	1	1	O0 to O7
		1	0	1	1	O23 to O31
	Case 4	0	0	1	0	O158 to O165
		1	0	1	0	O134 to O141
	Case 5	0	0	0	1	O158 to O165
		1	0	0	1	O8 to O15

## SED1560 Output Status

The SED1560 selects any output status from Cases 1, 2 and 6.

1/64 duty (Display Area 64 × 102)

Case	Status register				LCD driver output											
	D3	D2	D1	D0	O0	O31	O32	O101	O102	O133	O134	O165				
1	0	1	0	1	SEG102						COM0	→ COM63				
	1	1	0	1	SEG102						COM63	← COM0				
2	0	1	0	0	COM31	← COM0				SEG102				COM32	→ COM63	
	1	1	0	0	COM32	→ COM63				SEG102				COM31	← COM0	
6	-	0	0	0	SEG166											

1/48 duty (Display Area 48 × 102)

Case	Status register				LCD driver output											
	D3	D2	D1	D0	O0	O31	O32	O101	O102	O133	O134	O165				
1	0	1	0	1							COM0	→ COM47				
	1	1	0	1							COM47	← COM0				
2	0	1	0	0	COM31	← COM0				SEG102				COM32	→ 47	
	1	1	0	0	COM32	→ 47				SEG102				COM31	← COM0	
6	-	0	0	0	SEG166											

## SED1561 Output Status

The SED1561 selects any output status from Cases 3, 4, 5 and 6.

1/32 duty (Display Area 32 × 134)

Case	Status register				LCD driver output										
	D3	D2	D1	D0	O0	O15	O16	O31	O32	O133	O134	149	150	O165	
3	0	0	1	1	COM31	← COM0				SEG134					
	1	0	1	1	COM0	→ COM31				SEG134					
4	0	0	1	0	SEG134						COM0	→ COM31			
	1	0	1	0	SEG134						COM31	← COM0			
5	0	0	0	1	15←COM0	SEG134						COM16→31			
	1	0	0	1	COM16→31	SEG134						15←COM0			
6	-	0	0	0	SEG166										

1/24 duty (Display Area 24 × 134)

Case	Status register				LCD driver output										
	D3	D2	D1	D0	O0	O15	O16	O31	O32	O133	O134	149	150	O165	
3	0	0	1	1	COM23	← COM0				SEG134					
	1	0	1	1	COM0	→ COM23				SEG134					
4	0	0	1	0	SEG134						COM0	→ COM23			
	1	0	1	0	SEG134						COM23	← COM0			
5	0	0	0	1	15←COM0	SEG134						16→23			
	1	0	0	1	16→23	SEG134						15←COM0			
6	-	0	0	0	SEG166										

### SED1562 Output Status

COM/SEG output status of the SED1562 is fixed.  
1/16 duty (16 × 150)

LCD driver output		
00	0149	0165
SEG150		15 ← COM0

### Display Timers

#### Line counter and display data latch timing

The display clock, CL, provides the timing signals for the line counter and the display data latch. The RAM line address is generated synchronously using the display clock. The display data latch synchronizes the 166-bit display data with the display clock.

The timing of the LCD panel driver outputs is independent of the timing of the input data from the microprocessor.

#### FR and SYNC

The LCD AC signal, FR, and the synchronization signal, SYNC, are generated from the display clock. The FR controller generates the timing for the LCD panel driver outputs. Normally, 2-frame wave patterns are generated, but *n*-line inverse wave patterns can also be generated. These produce a high-quality display if *n* is based on the LCD panel being used.

SYNC synchronizes the timing of the line counter and common timers. It is also needed to synchronize the frame period and a 50% duty clock.

In a multiple-chip configuration, FR and SYNC are inputs. The SYNC signal from the master synchronizes the line counter and common timing of the slave.

#### Common timing signals

The internal common timing and the special-use common driver start signal, DYO, are generated from CL. As shown in figures 7 and 8, DYO outputs a HIGH-level pulse on the rising edge of the CL clock pulse that precedes a change on SYNC. DYO is generated by both the SED1560D0B, regardless of whether the device is in master or slave mode. However, when operating in slave mode, the device duty and the external SYNC signal must be the same as that of the master. In a multiple-chip configuration, FR and SYNC must be supplied to the slave from the master.

Table 6. Master and slave timing signal status

Part number	Mode	FR	SYNC	CLO	DYO
SD156*D*B	Master	Output	Output	CL output	Output
	Slave	Input	Input	High impedance	Output

2-frame AC driver waveform

(SED1561 1/32 duty)

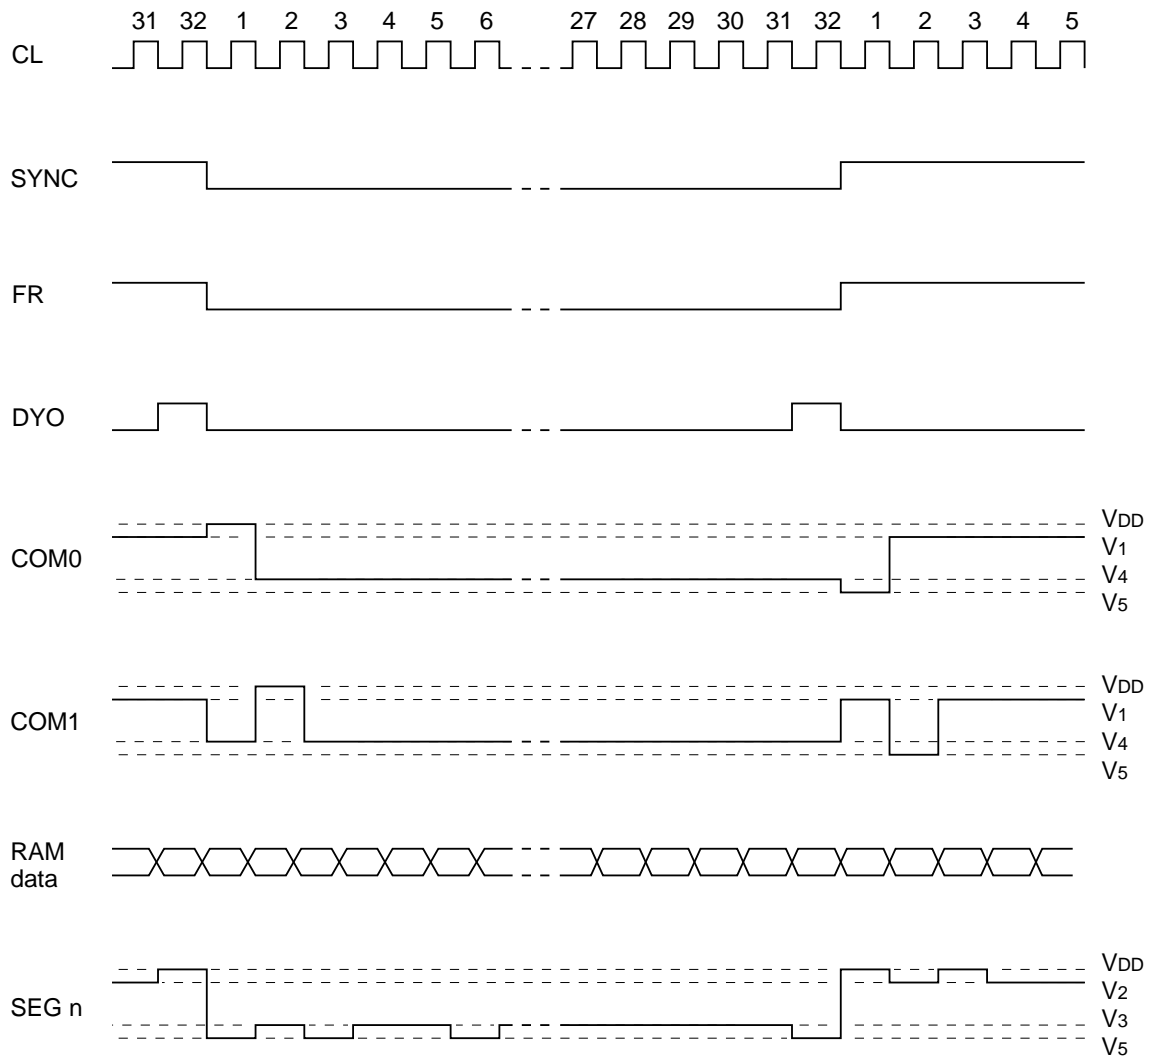

Figure 7. Frame driver timing

n line inverse driver waveform (n = 5, line inverse register 4)

Figure 8. Line inverse driver timing

**Note**

When  $n = 5$ , the line inversion register is set to 4.

### LCD Driver

The LCD driver converts RAM data into the 167 outputs that drive the LCD panel. There are 70 segment outputs, 96 segment or common dual outputs, and a COM1 output for the indicator display.

Two shift registers for the common/segment drivers are used to ensure that the common outputs are output in the correct sequence. The driver output voltages depend on the display data, the common scanning signal and FR.

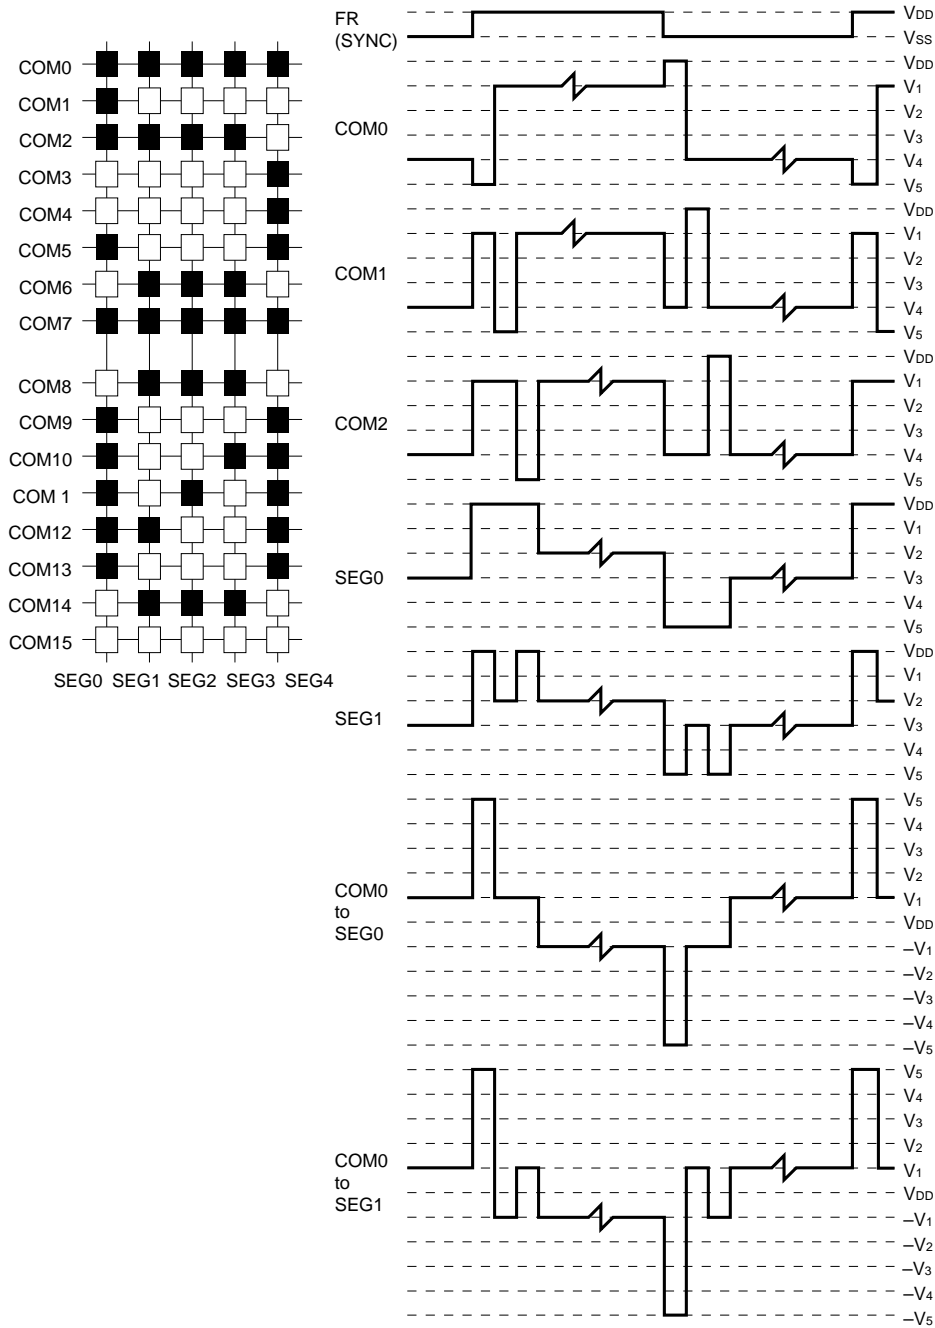

Figure 9. Example of segment and common timing

### Display Data Latch Circuit

The display data latch circuit temporarily stores the output display data from the display data RAM to the LCD driver circuit in each common period. Since the Normal/Inverse Display, Display ON/OFF and Display All Points ON/OFF commands control the data in this latch, the data in the display data RAM is remains unchanged.

### LCD Driver Circuit

This multiplexer generates 4-value levels for the LCD driver, having 167 outputs of 70 SEG outputs, 96 SEG/COM dual outputs and a COM output for the indicator display. The SEG/COM dual outputs have a shift register and sequentially transmits COM scanning signals. The LCD driver voltage is output according to the combination of display data, COM scanning signal and FR signal. Figure 9 shows a typical SEG/COM output waveform.

### Oscillator Circuit

The low power consumption type CR oscillator adjusting the oscillator frequency by use of only oscillator resistor  $R_f$  is used as a display timing signal source or clock for the voltage raising circuit of the LCD power supply. The oscillator circuit is only available in the master operation mode. When a signal from the oscillator circuit is used for display clock, fix the CL pin to the VSS level. When the oscillator circuit is not used, fix the OSC1 or OSC2 pin to the VDD or VSS level, respectively. The oscillator signal frequency is divided and output from the CLO pin as display clock. The frequency is divided to one-fourth, one-eighth or one-sixteenth in the SED1560, SED1561 or SED1562, respectively.

### FR Control Circuit

The LCD driver voltage supplied to the LCD driver outputs is selected using FR signal.

### Power Supply Circuit

This is a power circuit to produce voltage needed to drive liquid crystals at a low power consumption. This circuit is valid only when the SED156\*D\*B master is in operation. The power circuit consists of voltage tripler, voltage regulator and the voltage follower.

The power circuit built into SED1560\*D\*B is set for smaller scale liquid crystal panels and it is not too suitable when the picture element is larger or to drive a liquid crystal panel with lager indication capacity using multiple chips. With liquid crystal panels with a larger load capacity, the quality of display may become very bad. Use an external power in such cases. (If an external amp circuit is configured, we recommend to use the SCI7660 and SCI7661.)

The power circuit can be controlled by the built-in power ON/OFF command. When the built-in power is turned off, all of the boosting circuit, voltage regulation circuit and voltage follower circuit goes open. In this case, the liquid crystal driving voltage  $V_1$ ,  $V_2$ ,  $V_3$ ,  $V_4$  and  $V_5$  should be supplied from outside and the terminals CAP1+, CAP1-, CAP2+, CAP2-, Vout and  $V_R$  should be kept opened.

If the built-in power supply is turned on, you must always enter this command after the wait time of the built-in power supply turn-on completion command.

Various functions of the power circuit may be selected by combinations of the setting of the T1 and T2. It is also possible to make a combined use of the external power

T1	T2	Voltage tripler	Voltage regulator	voltage follower	External voltage input	Voltage tripler terminals	$V_R$ terminals
L	L	○	○	○	—		
L	H	○	○	○	—		
H	L	×	○	○	VOUT	OPEN	
H	H	×	×	○	V5	OPEN	OPEN

supply and a portion of the functions of the built-in power supply.

When (T1, T2) = (H, L), the boosting circuit does not work and open the boosting circuit terminals (CAP1+, CAP1-, CAP2+ and CAP2-) and apply liquid crystal driving voltage to the Vout terminals from outside.

When (T1, T2) = (H, H), the boosting circuit and voltage regulation circuit do not work and open the boosting circuit terminals and the VR terminals and apply liquid crystal driving voltage connecting the V5 terminals.

### Voltage tripler

By connecting capacitors C1 between CAP1+ and CAP1-, CAP2+ and CAP2- and VSS-Vout, the electric potential between VDD-VSS is boosted to the triple toward negative side and outputted from the Vout terminal. When a double boosting is required, disconnect the capacitor between CAP2+ and CAP2- and short-circuit the CAP2- and Vout terminals to obtain output boosted to the double out of the Vout (or CAP2-) terminal. Signals from the oscillation circuit are used in the boosting circuit and it then is necessary that the oscillation circuit is in operation. Electric potentials by the boosting functions are given below.

Electric potentials of double boosting

Electric potentials of triple boosting

### Voltage Regulator

The boosting voltage occurring at VOUT is sent to the voltage regulator, and the V5 liquid crystal display (LCD) driver voltage is output. This V5 voltage can be determined by the following equation when resistors Ra and Rb (R1, R2 and R3) are adjusted within the range of |V5| < |VOUT|.

$$V_5 = \left(1 + \frac{R_b}{R_a}\right) V_{REG} + I_{REF} \cdot R_b$$

$$= \left(1 + \frac{R_3 + R_2 - \Delta R_2}{R_1 + \Delta R_2}\right) V_{REG} + I_{REF} \cdot (R_3 + R_2 - \Delta R_2)$$

VREG is the constant voltage source of the IC, and it is constant and  $V_{REG} \doteq -2.5 \pm 0.15$  V (if VDD is 0 V). To adjust the V5 output voltage, insert a variable resistor between VR, VDD and V5 as shown. A combination of R1 and R3 constant resistors and R2 variable resistor is recommended for fine-adjustment of V5 voltage.

Setup example of resistors R1, R2 and R3: (In case of Type 1)

When the Electronic Volume Control Function is OFF (electronic volume control register values are (D4,D3,D2,D1,D0)=(0,0,0,0,0)):

$$V_5 = \frac{(1 + R_3 + R_2 - \Delta R_2)}{R_1 + \Delta R_2} V_{REG} \dots\dots\dots ①$$

- (As IREF = 0 A)
- $R_1 + R_2 + R_3 = 5M\Omega \dots\dots\dots ②$   
(Determined by the current passing between VDD and V5)
- Variable voltage range by R2  $V_5 = -6$  to  $-10$  V  
(Determined by the LCD characteristics)  
 $\Delta R_2 = 0\Omega, V_{REG} = -2.55V$   
To obtain  $V_5 = -10$  V, from equation ①:  
 $R_2 + R_3 = 2.92 \times R_1 \dots\dots\dots ③$   
 $\Delta R_2 = R_2, V_{REG} = -2.55V$   
To obtain  $V_5 = -6$  V, from equation ①:  
 $1.35 \times (R_1 + R_2) = R_3 \dots\dots\dots ④$

From equations ②, ③ and ④:  
R1=1.27MΩ  
R2=0.85MΩ  
R3=2.88MΩ

The voltage regulator has a temperature gradient of approximately -0.2%/°C as the V<sub>REG</sub> voltage. To obtain another temperature gradient, use the Electronic Volume Control Function for software processing using the MPU.

As the VR pin has a high input impedance, the shielded and short lines must be protected from a noise interference. In case of Type 2, similarly preset R1, R2 and R3 on the basis of V<sub>REG</sub> = V<sub>SS</sub>.

**Voltage regulator using the Electronic Volume Control Function**

The Electronic Volume Control Function can adjust the intensity (brightness level) of liquid crystal display (LCD) screen by command control of V<sub>5</sub> LCD driver voltage. This function sets five-bit data in the electronic volume control register, and the V<sub>5</sub> LCD driver voltage can be one of 32-state voltages.

To use the Electronic Volume Control Function, issue the Set Power Control command to simultaneously operate both the voltage regulator circuit and voltage follower circuit.

Also, when the boosting circuit is off, the voltage must be supplied from V<sub>OUT</sub> terminal.

When the Electronic Volume Control Function is used, the V<sub>5</sub> voltage can be expressed as follows:

$$V_5 = (1 + \frac{R_b}{R_a}) V_{REG} + R_b \times \Delta I_{REF} \dots\dots\dots \textcircled{5}$$

Variable voltage range

The increased V<sub>5</sub> voltage is controlled by use of I<sub>REF</sub> current source of the IC. (For 32 voltage levels, ΔI<sub>REF</sub> = I<sub>REF</sub>/31)

The minimum setup voltage of the V<sub>5</sub> absolute value is determined by the ratio of external Ra and Rb, and the increased voltage by the Electronic Volume Control Function is determined by resistor Rb. Therefore, the resistors must be set as follows:

- 1) Determine Rb resistor depending on the V<sub>5</sub> variable voltage range by use of the Electronic Volume Control.

$$R_b = \frac{V_5 \text{ variable voltage range}}{I_{REF}}$$

- 2) To obtain the minimum voltage of the V<sub>5</sub> absolute value, determine Ra using the Rb of Step 1) above.

$$R_a = \frac{R_b}{\frac{V_5}{V_{REG}} - 1} \quad \{V_5 = (1 + R_b/R_a) \times V_{REG}\}$$

The SED1526 series have the built-in V<sub>REG</sub> reference voltage and I<sub>REF</sub> current source which are constant during voltage variation. However, they may change due to the variation occurring in IC manufacturing and due to the temperature change as shown below.

Consider such variation and temperature change, and set the Ra and Rb appropriate to the LCD used.

$$\begin{aligned} &V_{REG} = -2.5V \pm 0.15V \} \text{Type1} \\ &V_{REG} = -0.2\%/^{\circ}C \\ &V_{REG} = V_{SS} \quad \} \text{Type2} \\ &V_{REG} = 0.00\%/^{\circ}C \\ &V_{REG} = -0.2\%/^{\circ}C \\ &I_{REF} = -3.2\mu A \pm 40\% \text{ (For 16 levels)} \\ &I_{REF} = 0.023\mu A/^{\circ}C \\ &\quad -6.5\mu A \pm 40\% \text{ (For 32 levels)} \\ &\quad 0.052\mu A/^{\circ}C \end{aligned}$$

Ra is a variable resistor that is used to correct the V<sub>5</sub> voltage change due to V<sub>REG</sub> and I<sub>REF</sub> variation. Also, the contrast adjustment is recommended for each IC chip. Before adjusting the LCD screen contrast, set the electronic volume control register values to (D4,D3,D2,D1,D0)=(1,0,0,0,0) or (0,1,1,1,1) first.

When not using the Electronic Volume Control Function, set the register values to (D4,D3,D2,D1,D0)=(0,0,0,0,0) by sending the  $\overline{RES}$  signal or the Set Electronic Volume Control Register command.

Setup example of constants when Electronic Volume Control Function is used:

V<sub>5</sub> maximum voltage: V<sub>5</sub> = -6 V (Electronic volume control register values (D4,D3,D2,D1,D0) = (0,0,0,0,0))

V<sub>5</sub> minimum voltages: V<sub>5</sub> = -10 V (Electronic volume control register values (D4,D3,D2,D1,D0) = (1,1,1,1,1))

V<sub>5</sub> variable voltage range: 4 V  
Variable voltage levels: 32 levels

- 1) Determining the Rb:

$$R_3 = \frac{V_5 \text{ variable voltage range}}{|I_{REF}|} = \frac{4V}{6.5\mu A}$$

Rb = 625KΩ

- 2) Determining the Ra:

$$R_a = \frac{R_b}{\frac{V_{5max}}{V_{REG}} - 1} = \frac{625K\Omega}{\frac{-6V}{-2.5V} - 1}$$

Ra = 462KΩ

According to the  $V_5$  voltage and temperature change, equation ⑤ can be as follows (if  $V_{DD} = 0$  V reference):

$T_a = 25^\circ\text{C}$

$$\begin{aligned} V_{5\text{max}} &= (1+R_b/R_a) \times V_{\text{REG}} \\ &= (1+625\text{k}/442\text{k}) \times (-2.55\text{V}) \\ &= -6.0\text{V} \\ V_{5\text{min}} &= V_{5\text{max}} + R_b \times I_{\text{REF}} \\ &= -6\text{V} + 625\text{k} \times (-6.5\mu\text{A}) \\ &= -10.0\text{V} \end{aligned}$$

$T_a = -10^\circ\text{C}$

$$\begin{aligned} V_{5\text{max}} &= (1+R_b/R_a) \times V_{\text{REG}} \quad (T_a = -10^\circ\text{C}) \\ &= (1+625\text{k}/462\text{k}) \times (-2.55\text{V}) \\ &\quad \times \{1+(-0.2\%/^\circ\text{C}) \times (-10^\circ\text{C}-25^\circ\text{C})\} \\ &= -6.42\text{V} \\ V_{5\text{min}} &= V_{5\text{max}} + R_b \times I_{\text{REF}} \quad (T_a = -10^\circ\text{C}) \\ &= -6.42\text{V} + 625\text{k} \\ &\quad \times \{-6.5\mu\text{A} + (0.052\mu\text{A}/^\circ\text{C}) \times \\ &\quad (-10^\circ\text{C}-25^\circ\text{C})\} \\ &= -11.63\text{V} \end{aligned}$$

$T_a = -50^\circ\text{C}$

$$\begin{aligned} V_{5\text{max}} &= (1+R_b/R_a) \times V_{\text{REG}} \quad (T_a = 50^\circ\text{C}) \\ &= (1+625\text{k}/462\text{k}) \times (-2.55\text{V}) \\ &\quad \times \{1+(-0.2\%/^\circ\text{C}) \times (50^\circ\text{C}-25^\circ\text{C})\} \\ &= -5.7\text{V} \\ V_{5\text{min}} &= V_{5\text{max}} + R_b \times I_{\text{REF}} \quad (T_a = 50^\circ\text{C}) \\ &= -5.7\text{V} + 625\text{k} \\ &\quad \times \{-6.5\mu\text{A} + (0.052\mu\text{A}/^\circ\text{C}) \times \\ &\quad (50^\circ\text{C}-25^\circ\text{C})\} \\ &= -8.95\text{V} \end{aligned}$$

The margin must also be determined in the same procedure given above by considering the  $V_{\text{REG}}$  and  $I_{\text{REF}}$  variation. This margin calculation results show that the  $V_5$  center value is affected by the  $V_{\text{REG}}$  and  $I_{\text{REF}}$  variation. The voltage setup width of the Electronic Volume Control depends on the  $I_{\text{REF}}$  variation. When the typical value of 0.2 V/step is set, for example, the maximum variation range of 0.12 to 0.28 V must be considered. In case of Type 2, it so becomes that  $V_{\text{REG}} = V_{\text{SS}}$  ( $V_{\text{DD}}$  basis) and there is no temperature gradient. However,  $I_{\text{REF}}$  carries the same temperature characteristics as with Type 1.

Example of V5 Voltage When Using SED1560 Series Electronic Volume

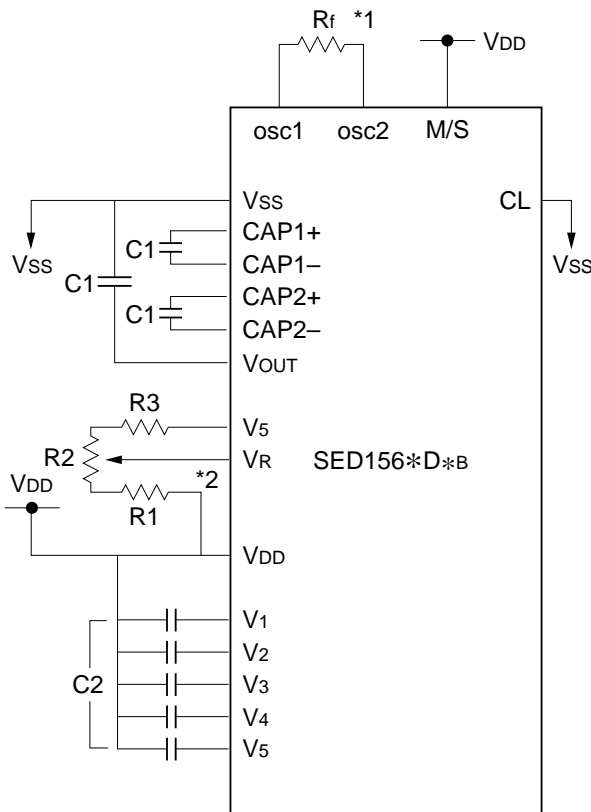

**Liquid Crystal Voltage Generating Circuit**

A V5 potential is resistively divided within the IC to cause V1, V2, V3 and V4 potentials needed for driving of liquid crystals. The V1, V2, V3 and V4 potentials are further converted in the impedance by the voltage follower before supplied to the liquid crystal driving circuit. The liquid crystal driving voltage is fixed with each type.

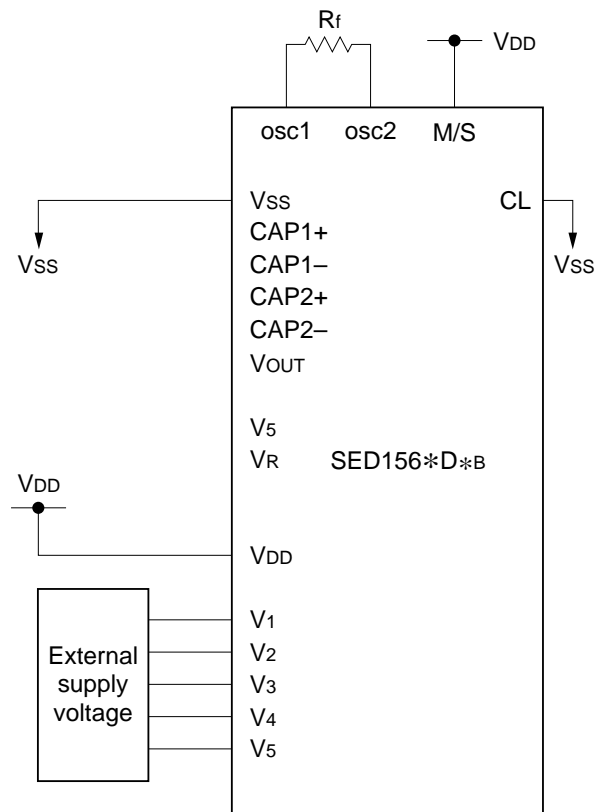

As shown in Fig. 8, it needs to connect, externally voltage stabilizing capacitors C2 to the liquid crystal power terminals. When selecting such capacitor C2 make actual liquid crystal displays matching to the display capacity of the liquid crystal display panel, before determining on the capacitance as the constant value for voltage stabilization.

types	Liquid crystal driving voltage
SED1560DoB	1/9 bias voltage
SED1560DAB	1/7 bias voltage
SED1561DoB	1/7 bias voltage
SED1561DAB	1/5 bias voltage
SED1562DoB	1/5 bias voltage

When the built-in power circuit is used

When the built-in power circuit is not used

Reference set values:

- SED1560 V<sub>5</sub> ≐ -11~ -13 V
- SED1561 V<sub>5</sub> ≐ -7~ -9 V
- SED1562 V<sub>5</sub> ≐ -5~ -7 V (Variable)

	SED1560	SED1561	SED1562
C1	4.7 μF	2.2 to 4.7 μF	2.2 to 4.7 μF
C2	0.1 to 0.47 μF	0.1 to 0.47 μF	0.1 μF
R1	1 MΩ	700 KΩ	500 KΩ
R2	200 KΩ	200 KΩ	200 KΩ
R3	4 MΩ	1.6 MΩ	700 KΩ
LCD SIZE	32×51 mm	16×67 mm	8×75 mm
DOT	64×102	32×134	16×150

\*1 Connect oscillator feedback resistor R<sub>f</sub> as short as possible and place it close to the IC for preventing a malfunction.

\*2 Use short wiring or shielded cables for the VR pin due to high input impedance.

\*3 Determine C<sub>1</sub>, C<sub>2</sub> depending on the size of LCD panel driven. You must set these values so that the LCD driving voltage becomes stable. Set (T<sub>1</sub>, T<sub>2</sub>)=(H, L) and supply an external voltage to V<sub>OUT</sub>. Display the LCD heavy load pattern and determine C<sub>2</sub> so that the LCD driving voltages (V<sub>1</sub> to V<sub>5</sub>) become stable. Then, set (T<sub>1</sub>, T<sub>2</sub>)=(L, L) and determine C<sub>1</sub>. Set the same capacitance for C<sub>2</sub>.

\*4 The "LCD SIZE" indicates the vertical and horizontal length of the LCD panel display area.

\* Precautions when installing the COG

When installing the COG, it is necessary to duly consider the fact that there exists a resistance of the ITO wiring occurring between the driver chip and the externally connected parts (such as capacitors and resistors). By the influence of this resistance, non-conformity may occur with the indications on the liquid crystal display. Therefore, when installing the COG design the module paying sufficient considerations to the following three points.

1. Suppress the resistance occurring between the driver chip pin to the externally connected parts as much as possible.
2. Suppress the resistance connecting to the power supply pin of the driver chip.
3. Make various COG module samples with different ITO sheet resistance to select the module with the sheet resistance with sufficient operation margin.

Also, as for this driver IC, pay sufficient attention to the following points when connecting to external parts for the characteristics of the circuit.

1. Connection to the boosting capacitors The boosting capacitors (the capacitors connecting to respective CAP pins and capacitor being inserted between VOUT and VSS2) of this IC are being switched over by use of the transistor with very low ON-resistance of about 10Ω. However, when installing the COG,

the resistance of ITO wiring is being inserted in series with the switching transistor, thus dominating the boosting ability.

Consequently, the boosting ability will be hindered as a result and pay sufficient attention to the wiring to respective boosting capacitors.

2. Connection of the smoothing capacitors for the liquid crystal drive

The smoothing capacitors for the liquid crystal driving potentials (V1, V2, V3 and V4) are indispensable for liquid crystal drives not only for the purpose of mere stabilization of the voltage levels. If the ITO wiring resistance which occurs pursuant to installation of the COG is supplemented to these smoothing capacitors, the liquid crystal driving potentials become unstable to cause non-conformity with the indications of the liquid crystal display. Therefore, when using the COG module, we definitely recommend to connect reinforcing resistors externally.

Reference value of the resistance is 100kΩ to 1MΩ. Meanwhile, because of the existence of these reinforcing resistors, current consumption will increase.

Indicated below is an exemplary connection diagram of external resistors.

Please make sufficient evaluation work for the display statuses with any connection tests.

Exemplary connection diagram 1.

Exemplary connection diagram 2.

### Reset

When power is turned ON, the SED1560 is initialized on the rising edge of  $\overline{RES}$ . Initial settings are as follows.

1. Display : OFF
2. Display mode : Normal
3. *n*-line inversion : OFF
4. Duty cycle : 1/64 (SED1560)  
1/32 (SED1561)
5. ADC select : Normal (D0 = L)
6. Read/write modify : OFF
7. Internal power supply : OFF
8. Serial interface register data: Cleared
9. Display initial line register : Line 1
10. Column address counter : 0
11. Page address register : Page 0
12. Output selection circuit : Case 6
13. *n*-line inversion register : 16
14. Set the electronic control register to zero (0).

$\overline{RES}$  should be connected to the microprocessor reset terminal so that both devices are reset at the same time.  $\overline{RES}$  must be LOW for at least 1  $\mu$ s to correctly reset the SED1560. Normal operation starts 1  $\mu$ s after the rising edge on  $\overline{RES}$ .

If the built-in LCD power circuit of the SED156\*D\*B is not used, the  $\overline{RES}$  signal must be low when the external LCD power supply is turned on. When the  $\overline{RES}$  goes low, each register is cleared to the above listed initial status. However, the oscillation circuit and output pins (OSC2, FR, SYNC, CLD, DY0, D0 to D7 pins) are not affected. If the SED1560 is not properly initialized when power is turned ON, it can lock itself into a state that cannot be cancelled.

Although SED1560 Series devices maintain the operation status under commands, when external noise of excessive levels enters, their internal status may be changed.

Consequently, it is necessary to provide means to suppress noise occurring from package or the system or provide means to avoid influence of such noise.

Also, to cope with sudden noise, we suggest you to set up the software so the operation status can be periodically refreshed.

When the Reset command is used, only initial settings 9 to 14 are active.

### COMMANDS

#### The Command Set

A0,  $\overline{RD}$ (E) and  $\overline{WR}$ (R/ $\overline{W}$ ) identify the data bus commands. Interpretation and execution of commands are synchronized to the internal clock. Since a busy check is normally not needed, commands can be processed at high speed.

For the 80-series MPU interface, the command is activated when a low pulse is entered in the  $\overline{RD}$  pin during read or when a low pulse is entered in the  $\overline{WR}$  pin during write. While the 68-series MPU interface is set to the read status when a high pulse is entered in the R/ $\overline{W}$  pin, and it is set to the write status when a low pulse is entered in this pin. The command is activated when a high pulse is entered in the E pin. (For their timings, see Section 10 "Timing Characteristics.") Therefore, the 68-series MPU interface differs from the 80-series MPU interface in the point where the  $\overline{RD}$  (or E) signal is 1 (or high) during status read and during display data read explained in the command description and on the command table. The following command description uses an 80-series MPU interface example.

If the serial interface is selected, data is sequentially entered from D7.

Table 7. SED1560 series command table

Command	Code											Function
	A0	$\overline{RD}$	$\overline{WR}$	D7	D6	D5	D4	D3	D2	D1	D0	
Display ON/OFF	0	1	0	1	0	1	0	1	1	1	0 1	Turns the LCD display ON and OFF 0 : OFF 1 : ON
Display START Line set	0	1	0	0	1	Display start address					Determines the RAM display line for COM 0	
Page address set	0	1	0	1	0	1	1	Page address				Sets the display RAM pages in the Page Address register.
Column address set; high-order 4 bits	0	1	0	0	0	0	1	High-order column address				Sets the high-order 4 bits of the display RAM column address in the register.
Column address set; low-order 4 bits	0	1	0	0	0	0	0	Low-order column address				Sets the low-order 4 bits of the display RAM column address in the register.

Command	Code											Function
	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	
Status read	0	0	1	Status				0	0	0	0	Reads the status information.
Display data write	1	1	0	Write Data								Writes data in the display RAM.
Display data read	1	0	1	Read Data								Reads data from the display RAM.
ADC select	0	1	0	1	0	1	0	0	0	0	0	Outputs the display RAM address for SEG. 0: Normal 1: Reversed
Normal/reverse display	0	1	0	1	0	1	0	0	1	1	0	Displays the LCD image in normal or reverse mode. 0: Normal 1: Reversed
All indicator ON/OFF	0	1	0	1	0	1	0	0	1	0	0	Lights all indicators. 0: Normal display 1: All ON
Duty select	0	1	0	1	0	1	0	1	0	0	0	Sets LCD drive duty (1). 0:1/24, 48 1:1/32, 64
Duty +1	0	1	0	1	0	1	0	1	0	1	0	Sets LCD drive duty (2). 0: Normal 1: Duty+1
n-line reverse register set	0	1	0	0	0	1	1	No. of reversed n-lines			Sets the line reverse driving and No. of reverse lines in the line reverse register.	
n-line reverse register release	0	1	0	0	0	1	0	0	0	0	0	Releases the line reverse driving.
Read Modify write	0	1	0	1	1	1	0	0	0	0	0	Increments by 1 during write of column address counter, and set to 0 during read.
End	0	1	0	1	1	1	0	1	1	1	0	Releases the Read Modify write mode.
Reset	0	1	0	1	1	1	0	0	0	1	0	Internal reset
Output status register set	0	1	0	1	1	0	0	Output status			Sets the COM and SEG status in registers.	
Built-in power supply ON/OFF	0	1	0	0	0	1	0	0	1	0	0	0: Power OFF 1: Power ON
Power-on completion	0	1	0	1	1	1	0	1	1	0	1	Completes the turn-on sequence of built-in power supply.
Electronic control register set	0	1	0	1	0	0	Electronic control value				Sets the V5 output voltage in the electronic control register.	
Power save												A complex command to turn off the display and light all indicators.

**Commands**

**Display ON/OFF**

Alternatively turns the display ON and OFF.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	1	1	1	D

**Note**

D = 0 Display OFF

D = 1 Display ON

**Initial Display Line**

Loads the RAM line address of the initial display line, COM0, into the initial display line register. The RAM display data becomes the top line of the LCD screen. It is followed by the higher number lines in ascending order, corresponding to the duty cycle. The screen can be scrolled using this command by incrementing the line address.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	0	1	A5	A4	A3	A2	A1	A0

A5	A4	A3	A2	A1	A0	Line address
0	0	0	0	0	0	0
0	0	0	0	0	1	1
0	0	0	0	1	0	2
↓						↓
1	1	1	1	1	0	62
1	1	1	1	1	1	63

**Page Address Set**

Loads the RAM page address from the microprocessor into the page address register. A page address, along with a column address, defines a RAM location for writing or reading display data. When the page address is changed, the display status is not affected.

Page address 8 is a special use RAM area for the indicator. Only D0 is available for data exchange.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	1	A3	A2	A1	A0

A3	A2	A1	A0	Page

0	1	0	0	4
0	1	0	1	5
0	1	1	0	6
0	1	1	1	7
1	0	0	0	8

**Column Address Set**

Loads the RAM column address from the microprocessor into the column address register. The column address is divided into two parts-4 high-order bits and 4 low-order bits.

When the microprocessor reads or writes display data to or from RAM, column addresses are automatically incremented, starting with the address stored in the column address register and ending with address 166. The page address is not incremented automatically.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	0	0	0	1	A7	A6	A5	A4

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0

A7	A6	A5	A4	A3	A2	A1	A0	Column address
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	1	1
↓								↓
1	0	1	0	0	1	0	1	165

**Read status**

Indicates to the microprocessor the four SED1560 status conditions.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	0	1	Busy	ADC	ON/OFF	RES-ET	0	0	0	0

- BUSY** Indicates whether or not the SED1560 will accept a command. If BUSY is 1, the device is currently executing a command or is resetting, and no new commands can be accepted. If BUSY is 0, a new command can be accepted. It is not necessary for the microprocessor to check the status of this bit if enough time is allowed for the last cycle to be completed.
- ADC** Indicates the relationship between RAM column addresses and the segment drivers. If ADC is 1, the relationship is normal and column address *n* corresponds to segment driver *n*. If ADC is 0, the relationship is inverted and column address (165 - *n*) corresponds to segment driver *n*.
- ON/OFF** Indicates whether the display is ON or OFF. If ON/OFF is 1, the display is OFF. If ON/OFF is 0, the display is ON. Note that this is the opposite of the Display ON/OFF command.
- RESET** Indicates when initialization is in process as the result of RES or the Reset command.

**Write Display Data**

Writes bytes of display data from the microprocessor to the RAM location specified by the column address and page address registers. The column address is incremented automatically so that the microprocessor can continuously write data to the addressed page.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
1	1	0	Write data							

**Read Display Data**

Sends bytes of display data to the microprocessor from the RAM location specified by the column address and page address registers. The column address is incremented automatically so that the microprocessor can continuously read data from the addressed page. A dummy read is required after loading an address into the column address register. Display data cannot be read through the serial interface.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
1	0	1	Read data							

**Select ADC**

Selects the relationship between the RAM column addresses and the segment drivers. When reading or writing display data, the column address is incremented as shown in figure 4.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	0	0	0	D

**Note**

- D = 0 Rotate right (normal direction)
- D = 1 Rotate left (reverse direction)

The output pin relationship can also be changed by the microprocessor. There are very few restrictions on pin assignments when constructing an LCD module.

**Normal/Inverse Display**

Determines whether the data in RAM is displayed normally or inverted.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	0	1	1	D

**Note**

- D = 0 LCD segment is ON when RAM data is 1 (normal).
- D = 1 LCD segment is ON when RAM data is 0 (inverse).

**Display All Points ON/OFF**

Turns all LCD points ON independently of the display data in RAM. The RAM contents are not changed. This command has priority over the normal/inverse display command.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	0	1	0	D

**Note**

- D = 0 Normal display status
- D = 1 All display segments ON

If this command is received when the display status is OFF, the Power Save command is executed.

### Select Duty

Selects the LCD driver duty.

Since this is independent from contents of the output status register, the duty must be selected according to the LCD output status.

In multi-chip configuration, the master and slave devices must have the same duty.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	1	0	0	D

Model	D	Duty
SED1560	0	1/48
	1	1/64
SED1561	0	1/24
	1	1/32
SED1562	0	1/16
	1	1/16

### Duty + 1

Increases the duty by 1. If 1/48 or 1/64 duty is selected in the SED1560 for example, 1/49 or 1/65 is set, respectively and COM1 functions as either the COM48 or COM64 output. The display line always accesses the RAM area corresponding to page address 8, D0. (Refer to Figure 4.)

In multi-chip configuration, the Duty + 1 command must be executed to both the master and slave sides.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	1	0	1	D

Model	D	Duty
SED1560	0	1/48 or 1/64
	1	1/49 or 1/65
SED1561	0	1/24 or 1/32
	1	1/25 or 1/33
SED1562	0	1/16
	1	1/17

### Set *n*-lineE Inversion

Selects the number of inverse lines for the LCD AC controller. The value of *n* is set between 2 to 16 and is stored in the *n*-line inversion register.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	0	0	1	1	A3	A2	A1	A0

A3	A2	A1	A0	Number of inverted lines
0	0	0	0	–
0	0	0	1	2
0	0	1	0	3
↓				↓
1	1	1	0	15
1	1	1	1	16

Do not use this command when using the voltage follower of the built-in power supply, the characteristics of the built-in power supply cannot then be guaranteed to stay within the specification.

### Cancel *n*-line Inversion

Cancels *n*-line inversion and restores the normal 2-frame AC control. The contents of the *n*-line inversion register are not changed.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	0	0	1	0	0	0	0	0

### Modify Read

Following this command, the column address is no longer incremented automatically by a Read Display Data command. The column address is still incremented by the Write Display Data command. This mode is cancelled by the End command. The column address is then returned to its value prior to the Modify Read command. This command makes it easy to manage the duplication of data from a particular display area for features such as cursor blinking.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	0	0	0	0

Note that the Column Address Set command cannot be used in modify-read mode.

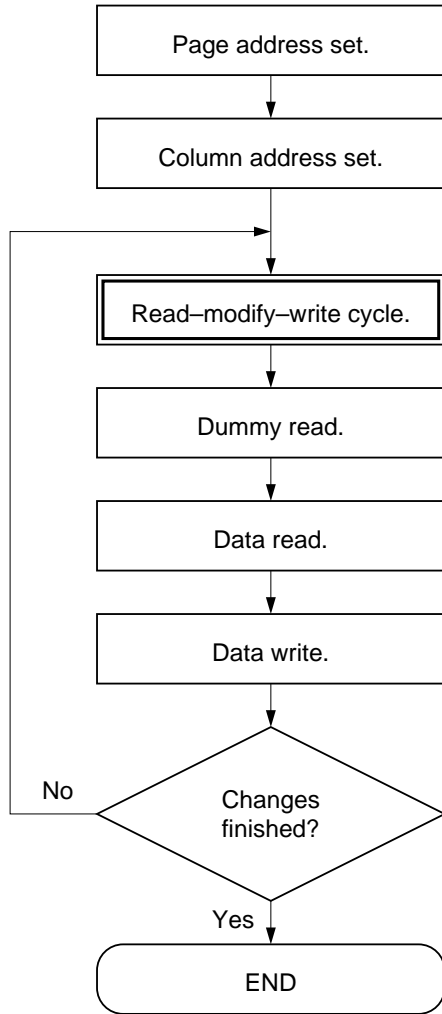

Figure 13. Command sequence for cursor blinking

**End**

Cancels the modify read mode. The column address prior to the Modify Read command is restored.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	1	1	1	0

**Reset**

Resets the initial display line, column address, page address, and *n*-line inversion registers to their initial values. This command does not affect the display data in RAM.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	0	0	1	0

The reset command does not initialize the LCD power supply. Only RES can be used to initialize the supplies.

**Output Status Register**

Available only in the SED1560 and SED1561. This command selects the role of the COM/SEG dual pins and determines the LCD driver output status. The COM output scanning direction can be selected by setting A3 to “H” or “L”. For details, refer to the Output Status Circuit in each function description.

A0	$\overline{E}$ RD	$\overline{R/W}$ WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	0	0	A3	A2	A1	A0

A3: Selection of the COM output scanning direction

A <sub>2</sub>	A <sub>1</sub>	A <sub>0</sub>	Output Status	Number of COM/SEG Output pins	Remarks
0	0	0	Case 6	SEG 166	Applies to the SED1560/61
0	0	1	Case 5	SEG 134, COM 32	Applies to the SED1561
0	1	0	Case 4	SEG 134, COM 32	
0	1	1	Case 3	SEG 134, COM 32	
1	0	0	Case 2	SEG 102, COM 64	Applies to the SED1560
1	0	1	Case 1	SEG 102, COM 64	
1	1	0	Case 6	SEG 166	Applies to the SED1560/61
1	1	1	Case 6	SEG 166	

### LCD Power Supply ON/OFF

Turns the SED156\*D\*B internal LCD power supply ON or OFF. When the power supply is ON, the voltage converter, the voltage regulator circuit and the voltage followers are operating. For the converter to function, the oscillator must also be operating.

A <sub>0</sub>	$\frac{E}{RD}$	$\frac{R\overline{W}}{WR}$	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	1	0	0	0	1	0	0	1	0	0

#### Note

D = 0 Supply OFF  
 D = 1 Supply ON

When an external power supply is used with the SED156\*D\*B, the internal supply must be OFF. If the SED156\*D\*B is used in a multiple-chip configuration, an external power supply that meets the specifications of the LCD panel must be used. An SED1560 operating as a slave must have its internal power supply turned OFF.

### Completion of Built-in Power On

This command turns on the built-in power supply.

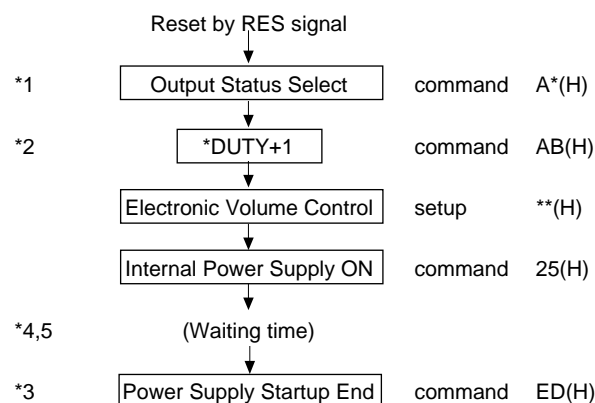

A <sub>0</sub>	$\frac{E}{RD}$	$\frac{R\overline{W}}{WR}$	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	1	0	1	1	1	0	1	1	0	1

The SED1560 series has the built-in, low-power LCD driving voltage generator circuit which can cut almost all currents except those required for LCD display. This is the primary advantage of the SED1560 series product. However, it has the low power and you need perform the following power-on sequence when turning on the built-in power supply:

### Sequence in the Built-in Power supply ON/OFF Status

To turn on built-in power supply, execute the above built-in power supply ON sequence. To turn off internal power supply execute the power save sequence as shown in the following power supply OFF status. Accordingly, to turn on built-in power supply again after turn it off (power save), execute the “Power Save Clear Sequence” that will be described afterwards.

#### Built-in power supply ON status

#### Built-in power supply OFF status

- \*1: Regarding the SED 1562, it is not necessary to execute a command to decide an output status.
- \*2: When the COMI pin is not used, it is not necessary to enter the DUTY+1 and DUTY+1 Clear commands.
- \*3: When the built-in power supply startup end command is not executed, current is consumed stationarily. Built-in power supply startup end command must always be used in a pair with built-in power supply ON command.
- \*4: The waiting time depends on the externally-installed capacitance C2 (refer to 4-35). After the waiting time shown in Graph 1, the power supply can be started surely.

\*5: Within the waiting time in built-in power supply ON status, any command other than built-in power supply control commands such as Power Save, and display ON/OFF command, display normal rotation/reverse command, display all ON command, output status select command and DUTY+1 clear command can accept another command without any problem. RAM read and write operations can be freely performed.

**Electronic Volume Control Register**

Through these commands, the liquid crystal driving voltage V<sub>5</sub> being outputted from the voltage regulation circuit of the built-in liquid crystal power supply, in order to adjust the contrast of the liquid crystal display. By setting data to the 4 bit register, one of the 16 voltage status may be selected for the liquid crystal driving voltage V<sub>5</sub>. External resistors are used for setting the voltage regulation range of the V<sub>5</sub>. For details refer to the paragraph of the voltage regulation circuit in the Clause for the explanation of functions.

A0	$\frac{E}{RD}$	$\frac{R/\bar{W}}{WR}$	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	A5	A4	A3	A2	A1	A0

A4	A3	A2	A1	A0	V <sub>5</sub>
0	0	0	0	0	Small (as the absolute value)
		:			
		:			
1	1	1	1	1	Large (as the absolute value)

When not using the electronic volume control function, set to (0, 0, 0, 0, 0).

**Power Save (Complex Command)**

If the Display All Points ON command is specified in the display OFF state, the system enters the power save status, reducing the power consumption to approximate the static power consumption value. The internal state in the power save status is as follows:

- (a) The oscillator and power supply circuits are stopped.
- (b) The LCD driver is stopped and segment and common driver outputs output the V<sub>DD</sub> level.
- (c) An input of an external clock is inhibited and OSC2 enters the high-impedance state.
- (d) The display data and operation mode before execution of the power save command are held.
- (e) All LCD driver voltages are fixed to the V<sub>DD</sub> level.

The power save mode is cancelled by entering either the Display ON command or the Display All Points OFF command (display operation state). When external voltage driver resistors are used to supply the LCD driver voltage level, the current through them must be cut off by the power save signal.

If an external power supply is used, it must be turned OFF using the power save signal in the same manner and voltage levels must be fixed to the floating or V<sub>DD</sub> level.

**Sequence in the Power Save Status**

Power Save and Power Save Clear must be executed according to the following sequence.

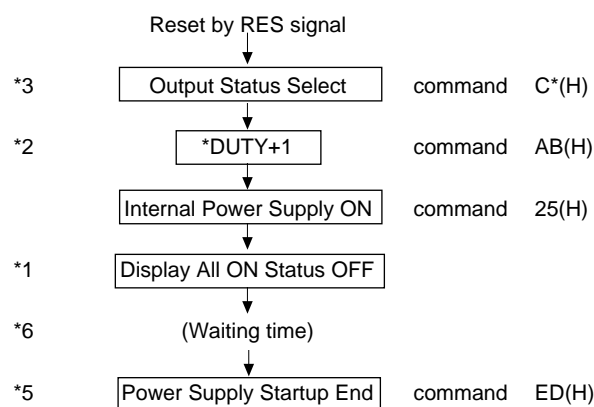

To give a liquid crystal driving voltage level by the externally-installed resistance dividing circuit, the current flowing in this resistance must be cut before or concurrently with putting the SED1560 series into the power save status so that it may be fixed to the floating or V<sub>DD</sub> level.

When using an external power supply, likewise, its function must be stopped before or concurrently with putting the SED1560 series into the power save status so that it may be fixed to the floating or V<sub>DD</sub> level. In a configuration in which an exclusive common driver such as SED1630 is combined with the SED1560 series, it is necessary to stop the external power supply function after putting all the common output into non-selection level.

Power save sequence

Power save clear sequence

- \*1: In the power save sequence, the power save status is provided after the display all ON command. In the power save clear sequence, the power save status is cleared after the display all ON status OFF command.
- \*2 When the COMI pin is not used, it is not necessary to enter the DUTY+1 command and DUTY+1 clear command.
- \*3 In the SED1562, it is not necessary to execute a command to decide an output status.
- \*4 The display ON command can be executed any-

where if it is later than the display all ON status OFF command.

- \*5 When internal power supply startup end command is not executed, current is consumed stationarily. Internal power supply startup end command must always be used in a pair with internal power supply ON command.
- \*6 The waiting time depends on the Externally-installed capacitance C2 (refer to 4-35). After the waiting time shown in the above Graph 1, the power supply can be started surely.

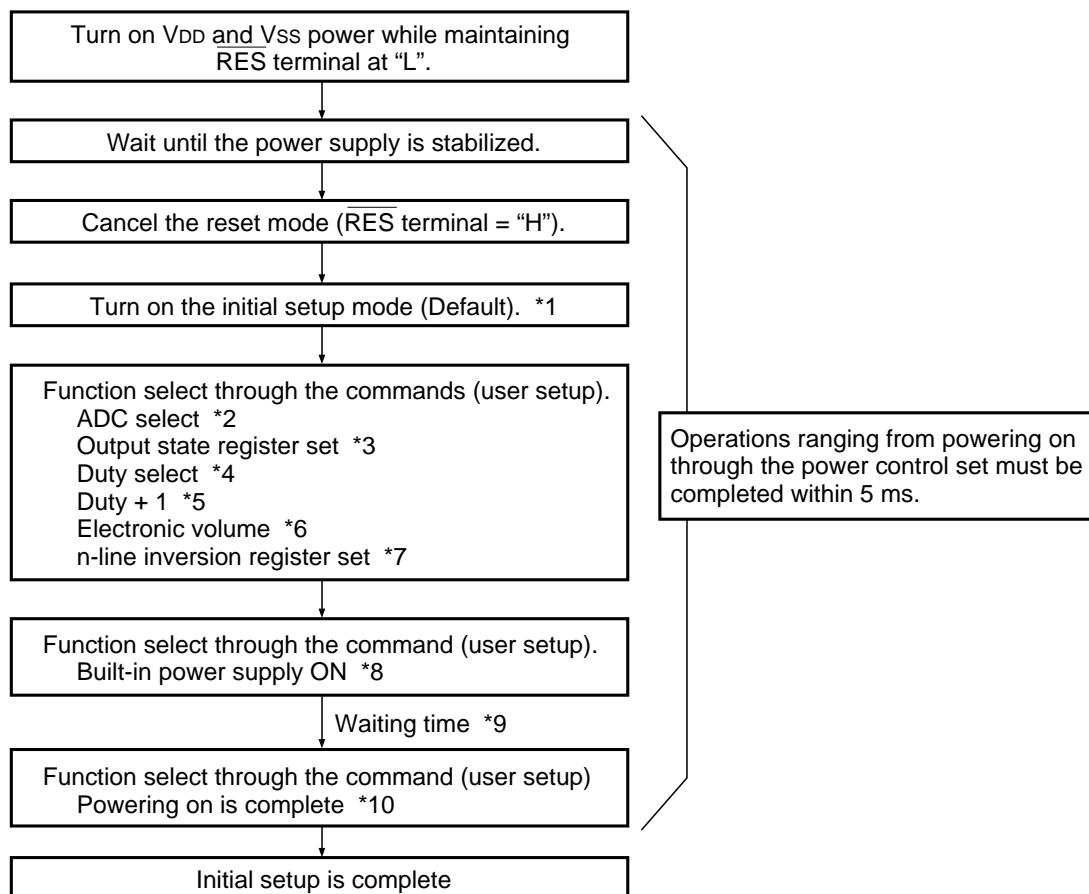

## COMMAND DESCRIPTION – INSTRUCTION SETUP EXAMPLES

### Instruction Setup Examples

#### Initial setup

Note: As power is turned on, this IC outputs non-LCD-drive potentials V<sub>2</sub> – V<sub>3</sub> from SEG terminal (generates output for driving the LCD) and V<sub>1</sub> – V<sub>4</sub> from COM terminal (also used for generating the LCD drive output). If charge remains on the smoothing capacitor being inserted between the above LCD driving terminals, the display screen can be blacked out momentarily. In order to avoid this trouble, it is recommended to employ the following powering on procedure.

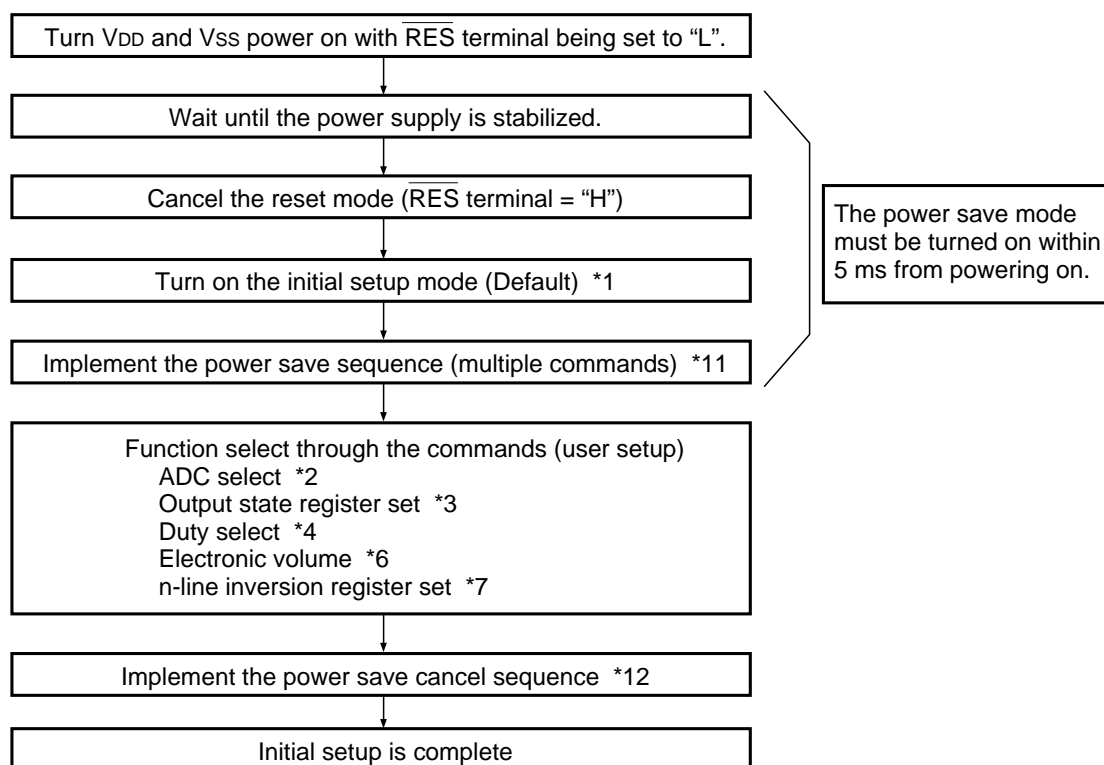

- When the built-in power is used immediately after the main power is turned on:

\* This duration of 5 ms depends on the panel characteristics as well as capacity of the capacitor concerned. Check them on the actual system.

- Notes:
- \*1: Refer to the “Reset Circuit” in the Function Description.
  - \*2: Refer to the “ADC Select” in the Command Selection (8).
  - \*3: Refer to the “Output State Register Set” in the Command Description (18).
  - \*4: Refer to the “Duty Select” in the Command Description (11).
  - \*5: Refer to the “Duty + 1” in the Command Description.
  - \*6: Refer to the “Supply Circuit” in the Function Description and the “Electronic Volume Register Set” in the Command Description (21).
  - \*7: Refer to the “n-line Inversion Register Set” in the Command Description (13).
  - \*8: Refer to the “Built-in Power Supply ON/OFF” in the Command Description (21).
  - \*9: Refer to the “Built-in Power Supply ON/OFF Sequence” in the Command Description.
  - \*10: Refer to the “Built-in Power Supply ON Complete” in the Command Description (20).

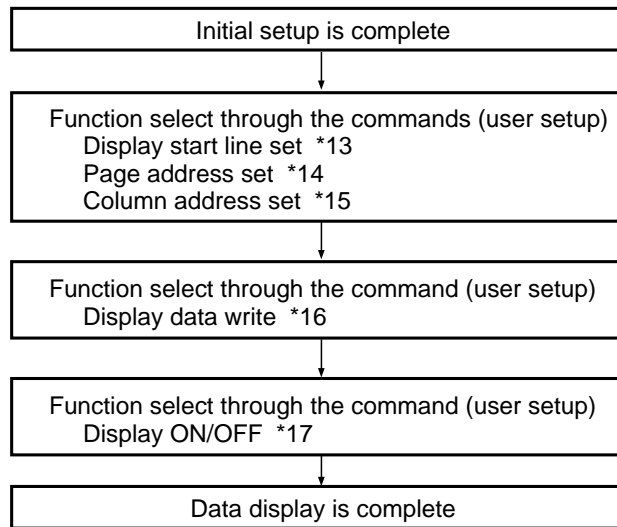

- When the built-in power supply is not used immediately after the main power is turned on:

\* This duration of 5 ms depends on the panel characteristics as well as capacity of the capacitor concerned. Check them on the actual system.

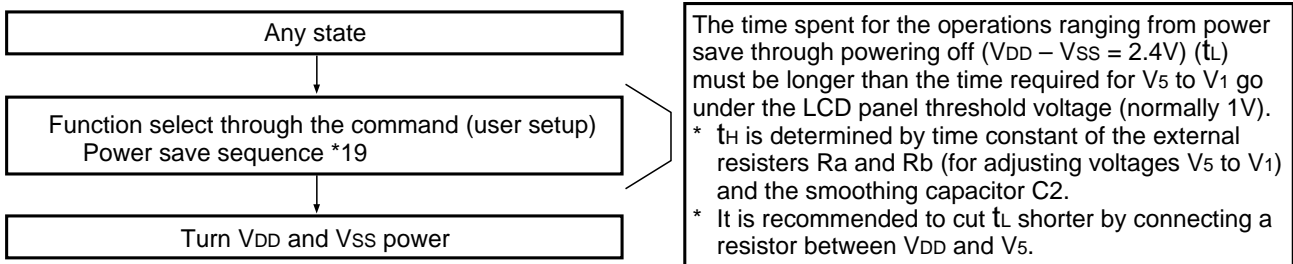

- Notes:
- \*1: Refer to the “Reset Circuit” in the Function Description.
  - \*2: Refer to the “ADC Select” in the Command Description (8).
  - \*3: Refer to the “Output State Register Set” in the Command Description (18)
  - \*4: Refer to the “Duty Select” in the Command Description (11).
  - \*6: Refer to the “Supply Circuit” in the Function Description and the “Electronic Volume Register Set” in the Command Description (21).
  - \*7: Refer to the “n-line Inversion Register Set” in the Command Description (13).
  - \*8: Refer to the “Built-in Power Supply ON/OFF” in the Command Description (19).
  - \*11,12: You can select either the sleep mode or standby mode for the power save mode. Refer to the “Power Save (Multiple Commands)” in the Command Description (22).

• Data Display

Notes: \*13: Refer to the “Display Line Set” in the Command Description (2).  
 \*14: Refer to the “Page Address Set” in the Command Description (3).  
 \*15: Refer to the “Column Address Set” in the Command Description (4).  
 \*16: Refer to the “Display Data Write” in the Command Description (6).  
 \*17: Refer to the “Display ON/OFF” in the Command Description (1).  
 It is recommended to avoid the all-white-display of the display start data.

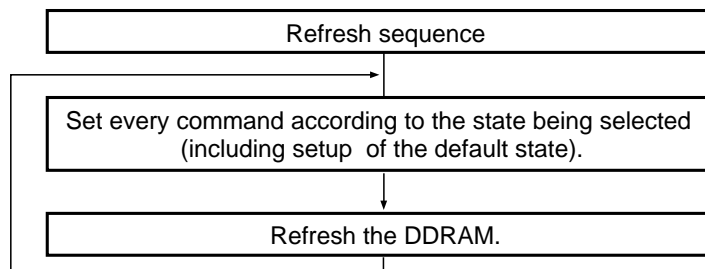

• Powering Off \*18

Notes: \*18: This IC functions as the logic circuit of the power supplies VDD – VSS, and used for controlling the driver of LCD power supplies VDD – V5. Thus, if power supplies VDD – VSS are turned off while voltage is still present on LCD power supplies VDD – V5, drivers (COM and SEG) may output uncontrolled voltage. Therefore, you are required to observe the following powering off procedure: Turn the built-in power supply off, then turn off the IC power supplies (VDD – VSS) only after making sure that potential of V5 – V1 is below the LCD panel threshold voltage level. Refer to the “Supply Circuit” in the Function Description.  
 \*19: When the power save command is entered, you must not implement reset from RES terminal until VDD – VSS power are turned off. Refer to the “Power Save” in the Command Description.

• Refresh

It is recommended to use the refresh sequence on a regular basis. This sequence, however, must not be turned on as long as the initial setup, data display or powering off sequence is taking place.

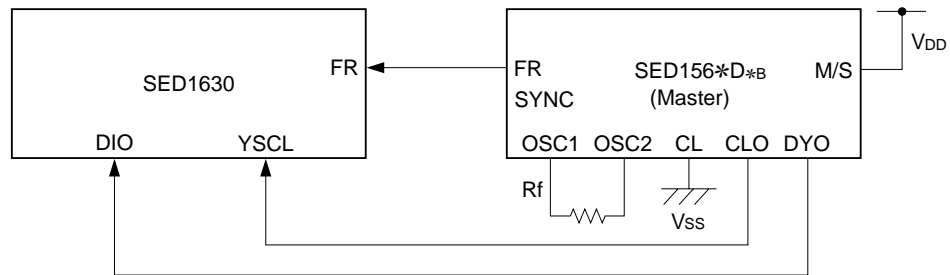

**Connection between LCD drivers**

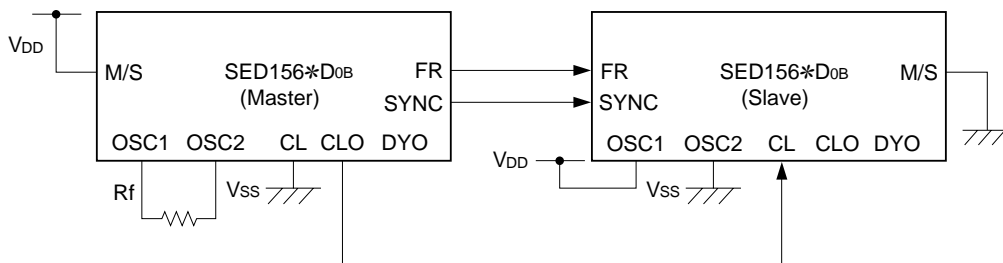

The LCD display area can be increased by using the SED1560 series in a multiple-chip configuration or with the SED1560 series special common driver (SED1630).

Application with external Driver

SED156\*D\*B-SED1630

SED156\*D\*B-SED156\*D\*B  
(when oscillator circuit is used)

SED156\*D\*B-SED156\*D\*B (External clock)

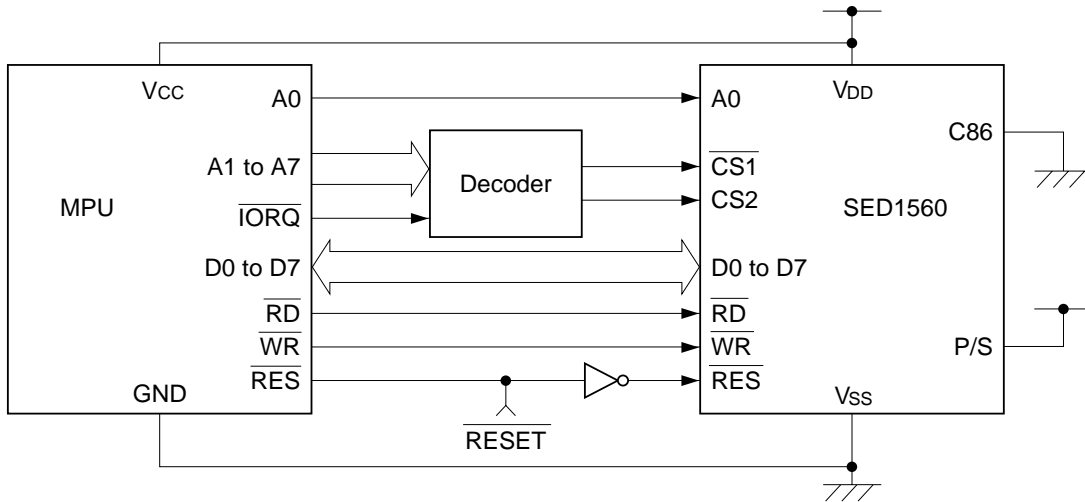

**Microprocessor Interface**

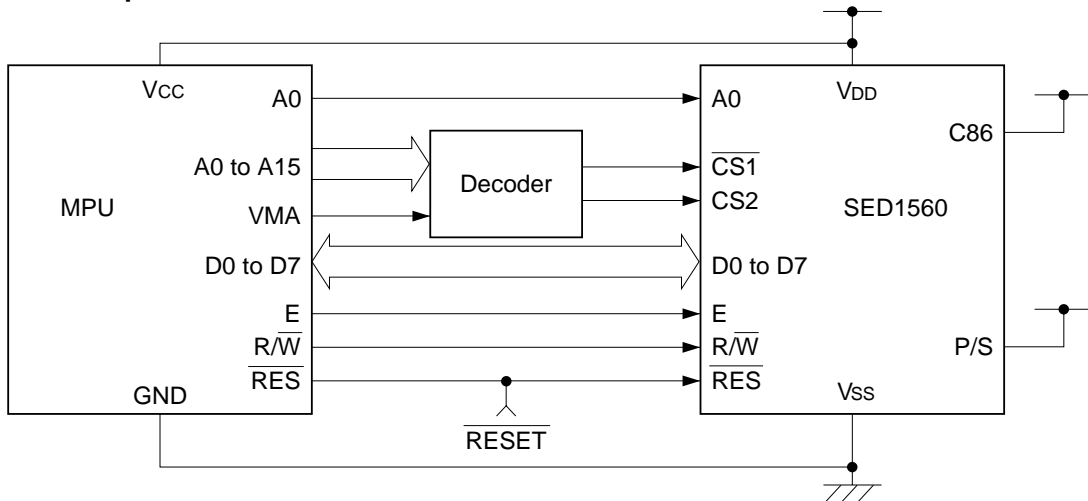

The SED1560 series interfaces to either 8080- or 6800-series microprocessors. The number of connections to the microprocessor can be minimized by using a serial

interface. When used in a multiple-chip configuration, the SED1560 is controlled by the chip select signals from the microprocessor.

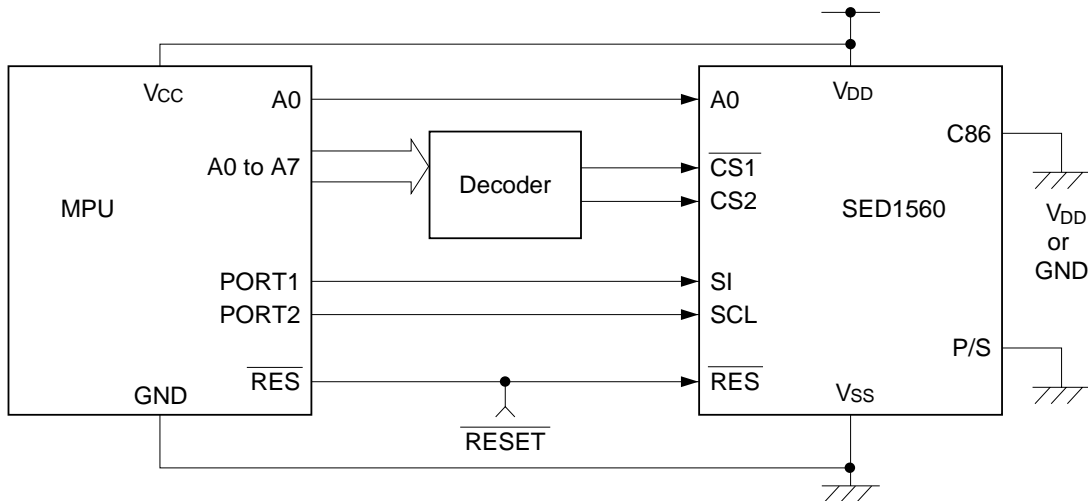

**8080-series microprocessors**

**6800-series microprocessors**

**Serial interface**
